

SED1640

Dot Matrix High Duty LCD Driver

- 80-bit Output
- 1/300 Duty Max.
- 2.7 to 5.5Vdc Logic Power Supply

DESCRIPTION

The SED1640 is the 80-segment (column) output driver that is appropriate to driving of a large-capacity, dot-matrix LCD panel.

The chip has been designed to improve the LCD display quality and it provides the high-speed enable chain method useful for lower power operation. The flat chip design allows more compact LCD panel production. The logic power supply allows low-voltage operation in a wide range of applications.

FEATURES

- No. of LCD drive outputs 80
- Super slim chip design
- Low current consumption
- Low voltage operation -2.7 Vdc Max.
- Wide range of LCD drive -8 to -28 Vdc voltages
- High-speed data transmission at the low Shift clock frequencies : 6.5 MHz (at -2.7 Vdc)
power by 4-bit bus enable chain method : 7.5 MHz (at -3.0 Vdc)
- Non-bias display off function
- Available pin selection in output shift direction
- Available offset bias adjustment of LCD power supply for V_{DD} level
- Logic power supply -2.7 to -5.5 Vdc
- Package Die form (Au bump): SED1640D08

PIN DESCRIPTION

Terminal name	I/O	Function	No. of pins																																					
O0 to O79	O	LCD drive segment output; the output changes at the LP falling edge.	80																																					
D0 to D3	I	Display data input	4																																					
XSCL	I	Shift clock input of display data (falling edge trigger)	1																																					
LP	I	Latch pulse input of display data (falling edge trigger)	1																																					
EIO1	I/O	Enable I/O	2																																					
EIO2		The terminals are set to the input or output according to the SHL input signal level. The output is reset by LP input. When the 80-bit data is read, the signal automatically goes high.																																						
SHL	I	Used for shift direction selection and I/O control input of EIO terminal. If data sets (a, b, c, d) (e, f, g, h) ... (w, x, y, z) are entered in this sequence in terminals (D3, D2, D1, D0), the data and segment output are processed as follows: <table border="1"><tr><td rowspan="4">S H L</td><td colspan="7">Output</td><td colspan="2">EIO</td></tr><tr><td>79</td><td>78</td><td>77</td><td>...</td><td>2</td><td>1</td><td>0</td><td>EIO1</td><td>EIO2</td></tr><tr><td>a</td><td>b</td><td>c</td><td>...</td><td>x</td><td>y</td><td>z</td><td>Output</td><td>Input</td></tr><tr><td>z</td><td>y</td><td>x</td><td>...</td><td>c</td><td>b</td><td>a</td><td>Input</td><td>Output</td></tr></table> Note: The relationship between the data and segment output is determined regardless of the number of shift clocks. ABSOLUTE MAXIMUM RATING

Rating	Symbol	Value	Unit
Power voltage (1)	VSS	-7.0 to +0.3	V
Power voltage (2)	V5	-30.0 to +0.3	V
Power voltage (3)	V0, V2, V3	V5 - 0.3 to VDD + 0.3	V
Input voltage	Vi	VSS - 0.3 to VDD + 0.3	V
Output voltage	Vo	VSS - 0.3 to VDD + 0.3	V
EIO output current	I01	20	mA
Operating temperature	Topr	-40 to +85	°C
Storage temperature 1	Tstg 1	-65 to +150	°C
Storage temperature 2	Tstg 2	-55 to +100	°C

- Notes:
- All voltages are based on VDD = 0 V.
 - Storage temperature 1 defines the storage temperature of the separate chip, and storage temperature 2 defines the TAB mounted chip.
 - The V0, V2 and V3 voltages must always satisfy the following:
VDD ≥ V0 ≥ V2 ≥ V3 ≥ V5

- If the logic power supply is floating or if it exceeds VSS = -2.6 Vdc when the LCD drive is powered, the LSI may be destroyed permanently. Cares must be taken especially when the system power supply is turned on or off.
