

### **2600Hz Digital Frequency Detector**

February 1993

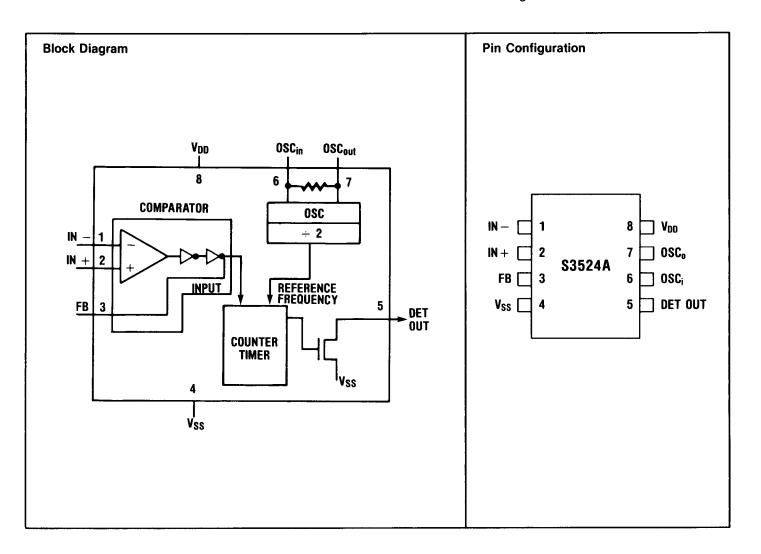

#### **Features**

- 2600Hz Center Frequency With 70Hz Bandwidth.
- Small 8-Pin Minidip Package
- Operation From a Low Cost 3.58MHz TV Colorburst Crystal or External Clock
- Input Comparator for Squaring and Sensitivity Adjustment
- Low Power CMOS Technology

### **Description**

The S3524 is a digital Frequency Detector used to accurately determine if an incoming tone is within a set of predefined limit frequencies. It checks every period of the incoming signal, giving a true output for each period falling within the desired bandwidth.

The S3524A, using a 3.58 MHz clock, will detect a 2600Hz frequency within 70Hz bandwidth. It is primarily designed to follow the S3526B 2600Hz bandpass filter as shown in Figure 4.

#### **Pin Description**

Name	Number	Description	
$V_{DD}$	8	Positive Power Supply. Typically +5V.	
$V_{SS}$	4	Negative Power Supply. Typically — 5V.	
IN IN + FB	1 2 3	Input comparator for setting sensitivity and squaring of analog signals. Signal sensitivity is controlled by selecting external resistors.	
DET OUT	5	The detector output. Open drain type output for ease of interface. DET OUT will be high after one full cycle of valid signal is detected, and will remain high until an out of frequency cycle is detected.	
OSC IN OSC OUT	6 7	Oscillator terminals for 3.58MHz reference crystal or clock. Uses standard TV crystal or a rail-to-rail CMOS clock may be used.
