**OCTAL D-TYPE LATCH WITH 3-STATE OUTPUT**

The TC74VHCT373A is an advanced high speed CMOS OCTAL LATCH with 3-STATE OUTPUT fabricated with silicon gate C<sup>2</sup>MOS technology.

It achieves the high speed operation similar to equivalent Bipolar Schottky TTL while maintaining the CMOS low power dissipation.

This 8-bit D-type latch is controlled by a latch enable input (LE) and a output enable input (OE).

When the OE input is high, the eight outputs are in a high impedance state.

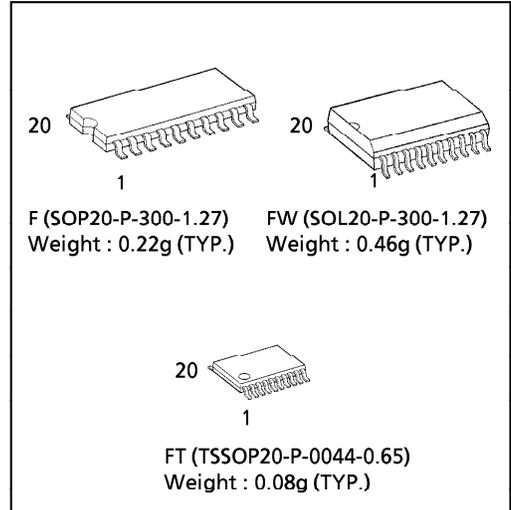

The input voltage are compatible with TTL output voltage. This device may be used as a level converter for interfacing 3.3V to 5V system.

Input protection and output circuit ensure that 0 to 5.5V can be applied to the input and output\*1 pins without regard to the supply voltage. These structure prevents device destruction due to mismatched supply and input/output voltages such as battery back up, hot board insertion, etc.

Average operating current can be obtained by the equation :

$$I_{CC(opr.)} = C_{PD} \cdot V_{CC} \cdot f_{IN} + I_{CC} / 8 \text{ (per latch)}$$

And the total C<sub>PD</sub> when n pcs. of Latch operate can be gained by the following equation :

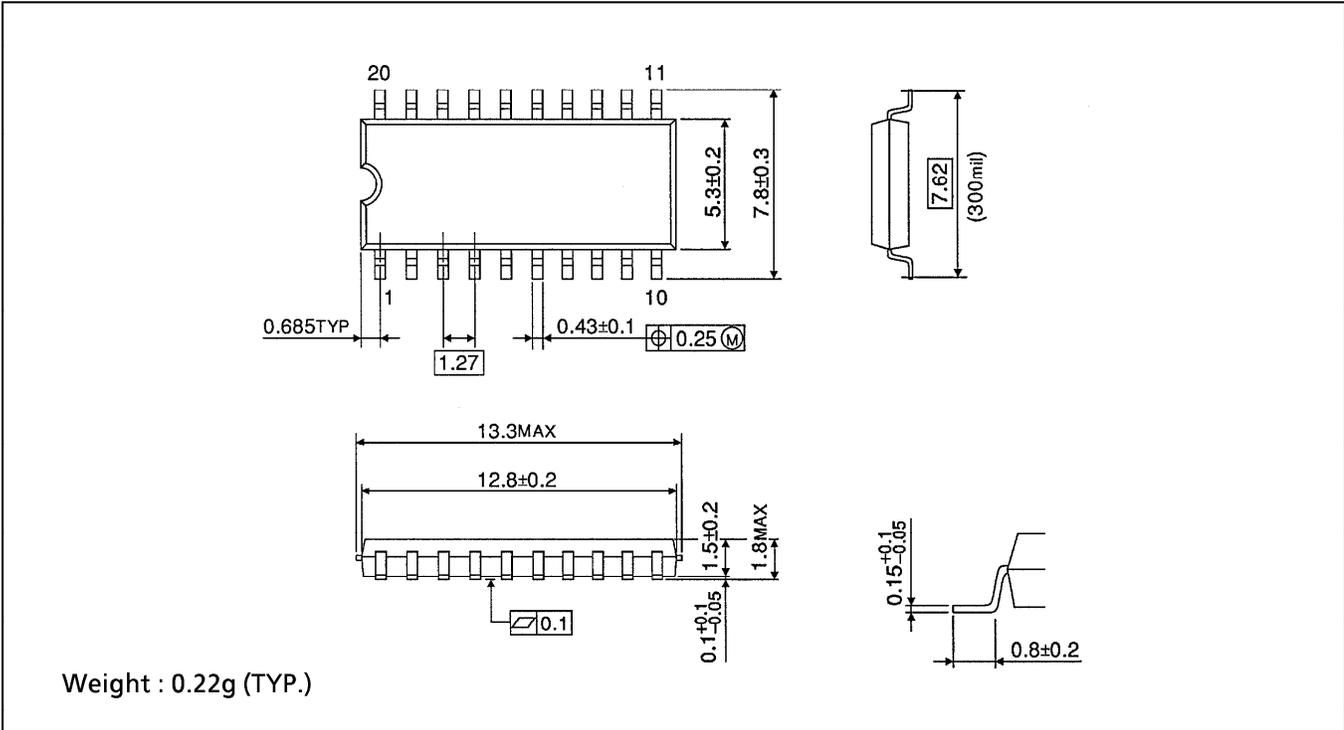

$$C_{PD} \text{ (total)} = 14 + 11 \cdot n$$
