

CMOS 8-Bit Microcontroller

TMP88PS76F

The TMP88PS76 are the high-speed and high performance 8-bit single chip microcomputers which built in a program storage area (64 Kbyte) and the One-Time PROM of vector table storage area (256 byte). The TMP88PS76 is pin compatible with the TMP88CP76/S76. The operations possible with the TMP88PS76 can be performed by writing programs to PROM. The TMP88PS76 can write and verify in the same way as the TC571000 an EPROM programmer.

Operational Description

The configuration and functions of the TMP88PS76 are the same as those of the TMP88CP76/S76, except in that a one-time PROM is used instead of an on-chip mask ROM.

1. Operating Mode

The TMP88PS76 has two modes: MCU and PROM.

1.1 MCU Mode

The MCU mode is activated by fixing the TEST / VPP pin at low level.

In the MCU mode, operation is the same as with the TMP88CP76/S76 (the TEST / VPP pin cannot be used open because it has no built-in pull-down resistance).

1.1.1 Program memory

The TMP88PS76 has a 64 Kbyte (addresses 04000_H to 13FFF_H in the MCU mode, addresses 00000_H to 0FFFF_H in the PROM mode) of program storage area and 256 byte (addresses FFF00 to FFFFF_H in the MCU mode, addresses 1FF00 to 1FFFF_H in the PROM mode) one-time PROM of vector table storage area.

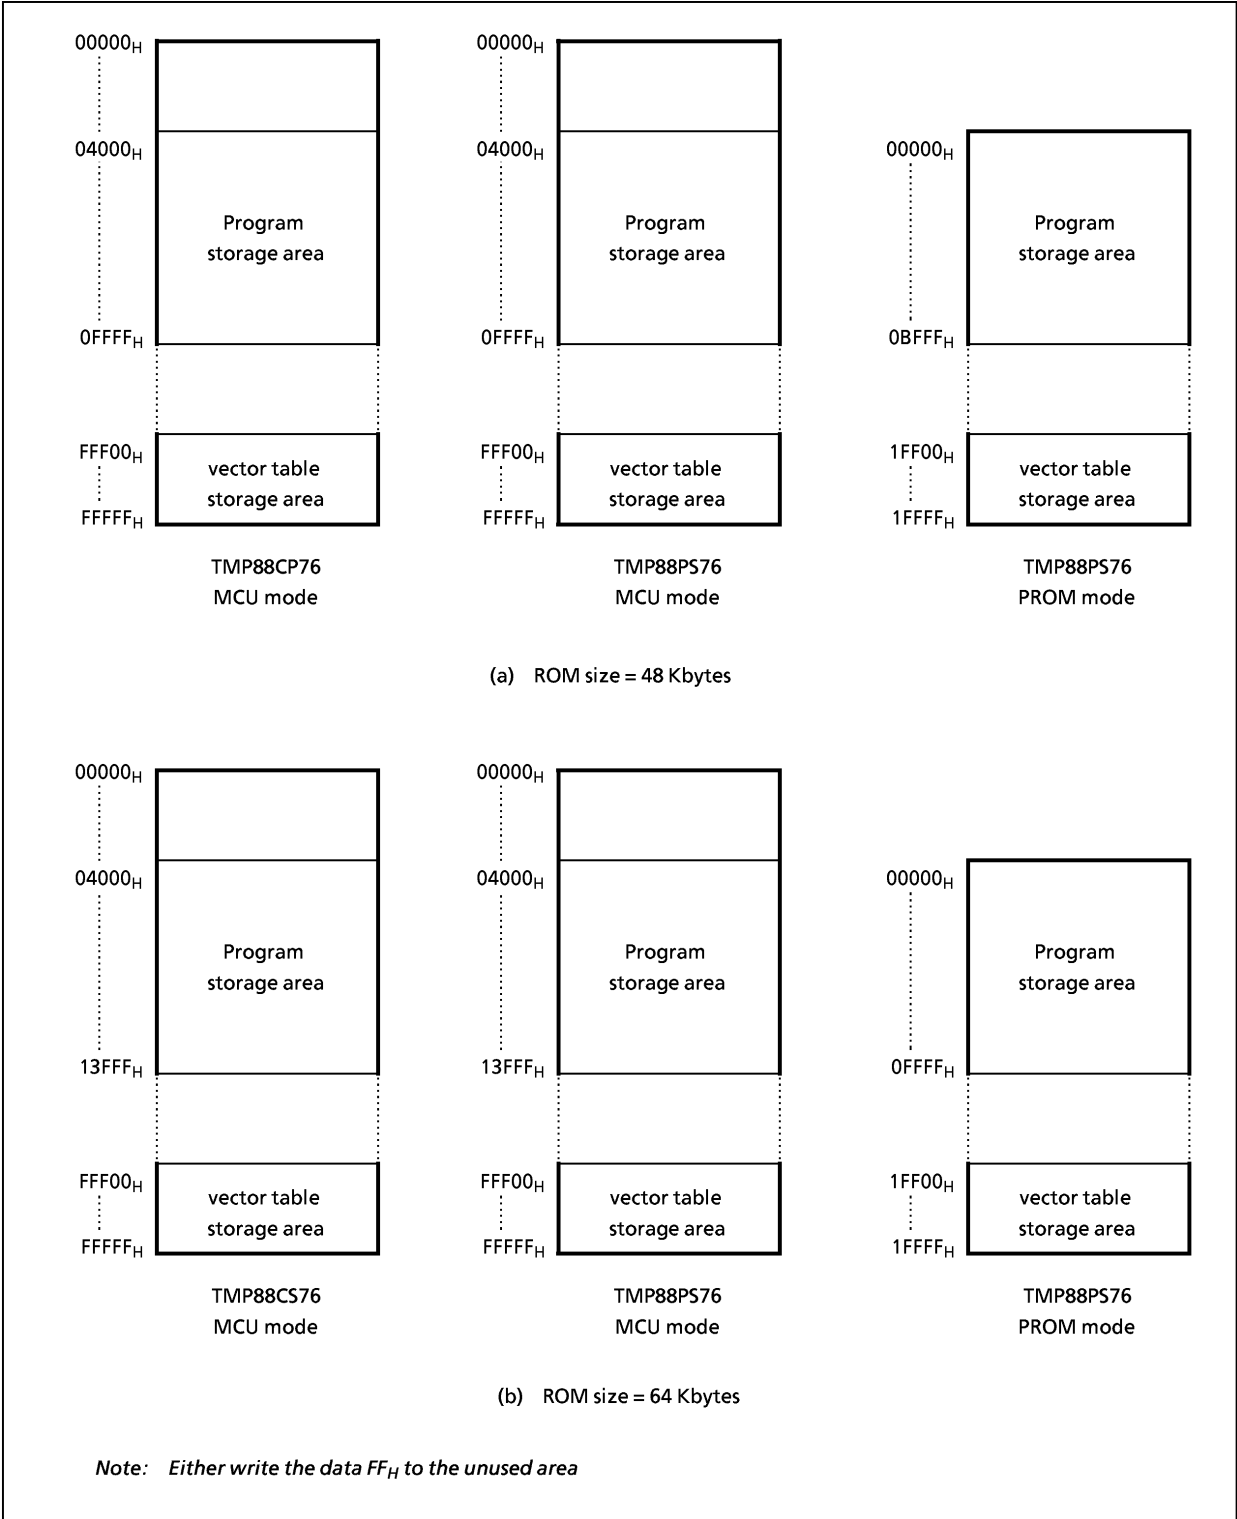

Figure 1-1. Program Storage Area

1.1.2 Data memory

The TMP88PS76 has an on-chip 2 Kbyte data memory (static RAM).

1.1.3 Input/output circuitry

(1) Control pins

The control pins of the TMP88PS76 are the same as those of the TMP88CP76/S76 except that the TEST pin has no built-in pull-down resistance.

Figure 1-2. TEST Pin

(2) I/O ports

The I/O circuitries of TMP88PS76 I/O ports are the same as the TMP88CP76/S76.

1.2 PROM Mode

The PROM mode is activated by setting shown in Figure 1-2. The PROM mode is used to write and verify programs with a general-purpose PROM programmer. The high-speed programming mode can be used for program operation.

The TMP88PS76 is not supported an electric signature mode, so the ROM type must be set to TC571000. Set the adaptor socket switch to "N".

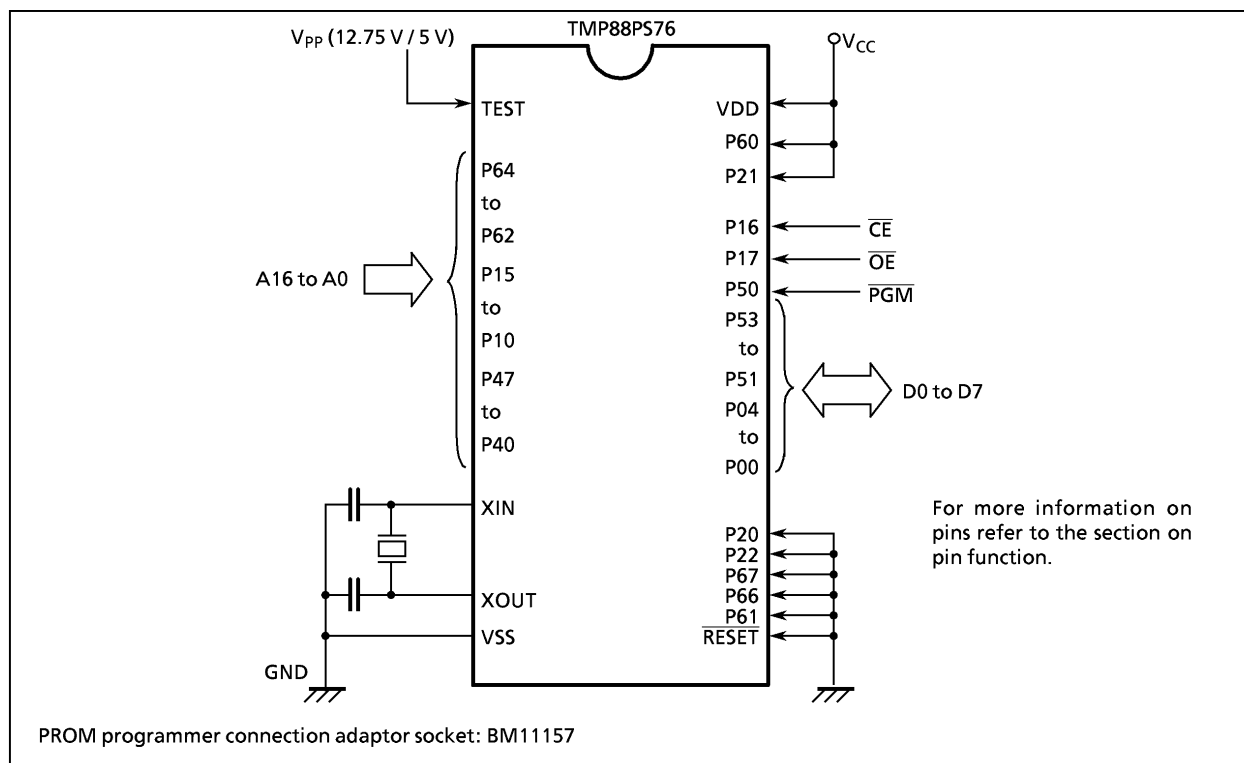

Figure 1-3. Setting for PROM Mode

1.2.1 Programming flowchart (High-speed programming)

The high-speed programming mode is achieved by applying the program voltage (+ 12.75 V) to the Vpp pin when Vcc = 6.25 V. After the address and input data are stable, the data is programmed by applying a single 0.1ms program pulse to the \overline{CE} input. The programmed data is verified. If incorrect, another 0.1ms program pulse is applied and then the programmed data is verified. This process should be repeated (up to 25 times) until the program operates correctly. After that, change the address and input data, and program as before. When programming has been completed, the data in all addresses should be verified with Vcc = Vpp = 5 V.

(2) Adapter setting

Switch (SW1) is set to side N.

(3) PROM programmer specifying

i) PROM type is specified to TC571000.

Writing voltage: 12.75 V (high-speed program)

ii) Data transfer (copy) (Note 1)

In TMP88PS76, EPROM is within the addresses 00000_H to 0FFFF_H and 1FF00_H to 1FFFF_H. Data is required to be transferred (copied) to the addresses where it is possible to write. The program area in MCU mode and PROM mode is referred to "Program memory area" in Figure 1-1.

Ex. In the block transfer (copy) mode, executed as below.

Program area: transferred addresses 04000_H to 13FFF_H to addresses 00000 to 0FFFF_H

Vector area: transferred addresses FFF00_H to FFFFF_H to 1FF00 to 1FFFF_H

iii) Writing address is specified. (Note 1)

Start address: 00000_H

End address: 1FFFF_H

(4) Writing

Writing/Verifying is required to be executed in accordance with PROM programmer operating procedure.

Note 1: The specifying method is referred to the PROM programmer description. Either write the data FF_H to the unused area or set the PROM programmer to access only the program storage area.

Note 2: When MCU is set to an adapter or the adapter is set to PROM programmer, a position of pin 1 must be adjusted. If the setting is reversed, MCU, the adapter and PROM program is damaged.

Note 3: The TMP88PS76 does not support the electric signature mode (hereinafter referred to as "signature"). If the signature is used in PROM program, a device is damaged due to applying 12 V ± 0.5 V to the address pin 9 (A9). The signature must not be used.

Thus, when designing products which include this device, ensure that no absolute maximum rating value will ever be exceeded.

Note 2: Power Dissipation (PD) ; For PD, it is necessary to decrease -14.3 mW/°C. (Reference to TMP88CP76/S76)

If the device is used under operating conditions other than the recommended operating conditions (supply voltage, operating temperature range, specified AC/DC values etc.), malfunction may occur. Thus, when designing products which include this device, ensure that the recommended operating conditions for the device are always adhered to.
