CMOS 4-BIT MICROCONTROLLER

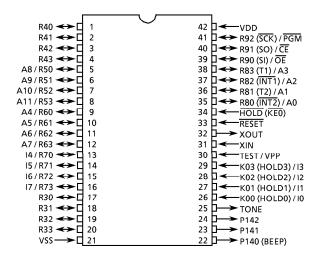

TMP47P407VN TMP47P407VF

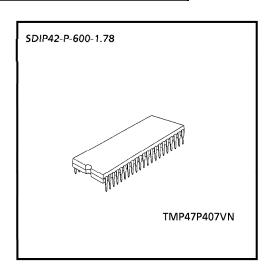

The 47P407V is the OTP microcontroller with 32kbits PROM. For program operation, the programming is achieved by using with EPROM programmer (TMM2764AD type) and adapter socket (BM1120, BM1121). A.C./D.C characteristics are equivalent to Mask-programed ROM device.

For a discussion of how the reliability of microcontrollers can be predicted, please refer to Section 1.3 of the chapter entitled Quality and Reliability Assurance/Handling Precautions.

TOSHIBA is continually working to improve the quality and the reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to observe standards of safety, and to avoid situations in which a malfunction or failure of a TOSHIBA product could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent products specifications. Also, please keep in mind the precautions and conditions set forth in the TOSHIBA Semiconductor Reliability Handbook.

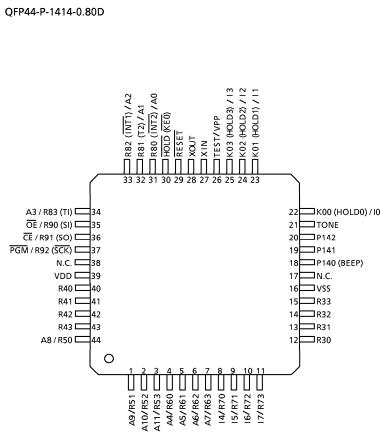

The products described in this document are subject to foreign exchange and foreign trade laws.

PIN FUNCTION

The 47P407V has MCU mode and PROM mode.

(1) MCU mode

The 47C407A and the 47P407V are pin compatible (TEST pin for out-going test. Be fixed to low level).

(2) PROM mode

PIN NAME	Input/Output	FUNCTIONS	PIN NAME (MCU MODE)
A11 to A8			R53 to R50
A7 to A4	Input	Address inputs	R63 to R60
A3 to A0			R83 to R80
17 to 14	1/0	But it and the term	R73 to R70
13 to 10	I/O	Data inputs / outputs	K03 to K00
PGM		Program control input	R92
CE	Input	Chip Enable input	R91
ŌĒ		Output Enable input	R90
VPP		+ 12.5V / 5V (Program supply voltage)	TEST
vcc	Power supply	+ 5V	VDD
VSS		ov	VSS
TONE	Output	Open	
R33 to R30	1/0	Po fined to level and	
R43 to R40	I/O	Be fixed to low level	
P142 to P140	Output	Open	
RESET	Input	DROM and decention since Defined to level and	
HOLD	Input	PROM mode setting pins. Be fixed to low level.	
XIN	Input	External clock input (to keep the internal state stable)	
XOUT	Output	Open	

OPERATIONAL DESCRIPTION

The following is an explanation of hardware configuration and operation in relation to the 47P407V. The 47P407V is the same as the 47C407A except that an OTP is used instead of a Mask ROM.

1. OPERATION MODE

The 47P407V has an MCU mode and a PROM mode.

1.1 MCU Mode

The MCU mode is set by fixing the TEST / VPP pin at the "L" level. Operation in the MCU mode is the same as for the 47C407A, except that the TEST / VPP pin does not have pull-down resistor and cannot be used open.

1.1.1 Program Memory

The program storage area is the same as for the 47C407A.

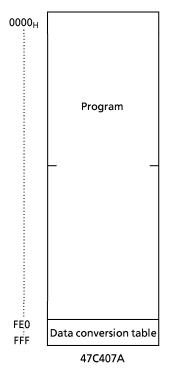

Figure 1-1. Program area

1.1.2 Data Memory

The 47P407V has 768 × 4-bit data memory.

1.1.3 Input/Output Circuitry

(1) Control pins

This is the same as for the 47C407A except that there is no built-in pull-down resistance for the TEST pin.

(2) I/O Ports

The input/output circuit of the 47P407V is the same as I/O code WB of the 47C407A. External resistance, for example, is required when using as evaluator of other I/O codes (WE, WH) (Refer to Figure 1-2).

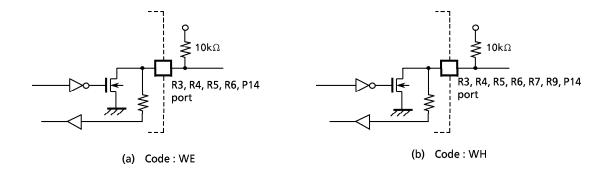

Figure 1-2. I/O code and external circuitry

1.2 PROM Mode

The PROM mode is set by setting the RESET, HOLD pins to the "L" level. The PROM mode can be used as a general-purpose PROM writer for program writing and verification (A high-speed program mode is used set the ROM type the same as for the TMM2764AD).

An adapter socket (part No. BM1120 / BM1121) is available for connecting a PROM writer.

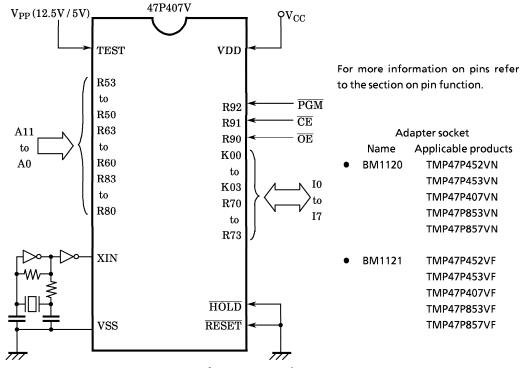

Figure 1-3. Setting for PROM mode

1.2.1 Writing

Set the PROM writer ROM to TMM2764AD (64k-bit), or equivalent. Before writing to a 47P407V (32k-bit), set the data area for writing to 32k-bits (start address: 0000_H , ending address: $0FFF_H$), or else load the same data to the first 32k bits (0000_H - $0FFF_H$) and the second 32k bits (1000_H - $1FFF_H$).

1.2.2 High Speed Programming Mode

The device is set up in the high speed programming mode when the programming voltage (12.5V) is applied to the Vpp terminal with Vcc = 6V and $\overline{PGM} = V_{IH4}$. The programming is achieved by applying a Single TTL low level 1 ms, pulse the \overline{PGM} input after addresses and data are stable. Then the programmed data is verified by using program Verify Mode. If the programmed data is not correct, another program pulse of 1 ms is applied and then programmed data is verified. This should be repeated until the program operates correctly (max. 15 times). After correctly programming the selected address, one additional program pulse with pulse width 4 times that needed for programming is applied. When programming has been completed, the data in all addresses should be verified with
