

DUAL WIDE BAND OPERATIONAL AMPLIFIER FOR ADSL LINE INTERFACE

- LOW NOISE : $3.2\text{nV}/\sqrt{\text{Hz}}$, $1.5\text{pA}/\sqrt{\text{Hz}}$
- HIGH OUTPUT CURRENT : 160mA min.
- VERY LOW HARMONIC AND INTERMODULATION DISTORTION
- HIGH SLEW RATE : $40\text{V}/\mu\text{s}$
- SPECIFIED FOR 25Ω LOAD

DESCRIPTION

This device is particularly intended for applications where multiple carriers must be amplified simultaneously with very low intermodulation products. It has been mainly designed to fit with ADSL chip-set such as ST70134 or ST70135.

The TS634 is a high output current dual operational amplifier, with a large gain-bandwidth product (130MHz) and capable of driving a 25Ω load at 12V power supply. The TS634 is fitted out with Power Down function in order to decrease the consumption.

The TS634 is housed in SO20 batwing plastic package for a very low thermal resistance. Also available in TSSOP14 for space saving.

APPLICATION

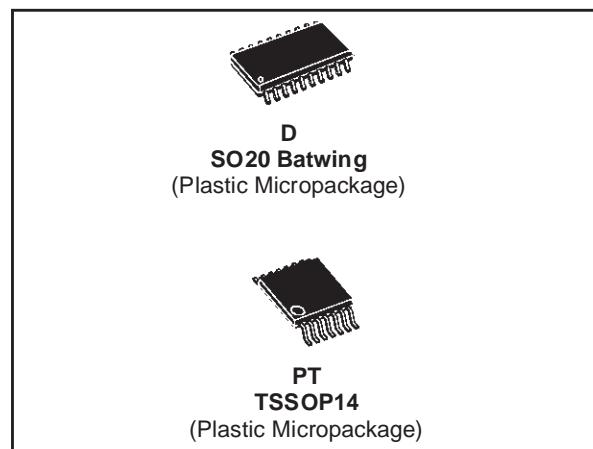

- UPSTREAM line driver for Asymmetric Digital Subscriber Line (ADSL) (NT).

ORDER CODE

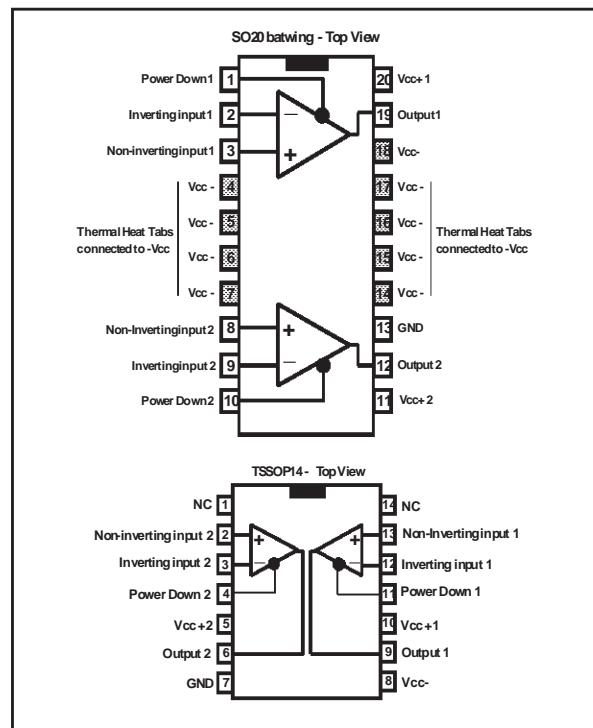

| Part Number | Temperature Range | Package | |
|-------------|-------------------|---------|---|

| $P_{max.}$ | Maximum Power Dissipation (@25°C) | 1.1 | W |
| | Output Short Circuit Duration | 4) | |

1. All voltages values, except differential voltage are with respect to network terminal.

2. Differential voltages are non-inverting input terminal with respect to the inverting input terminal.

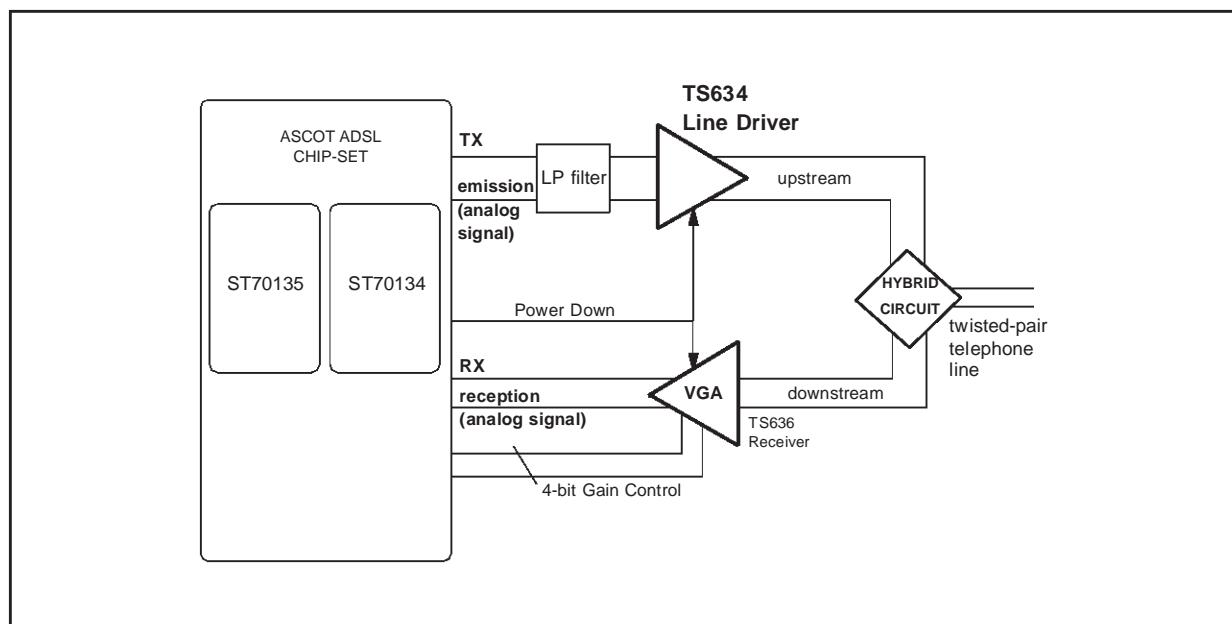

3. The magnitude of input and output voltages must never exceed $V_{CC} + 0.3V$.

4. An output current limitation protects the circuit from transient currents. Short-circuits can cause excessive heating. Destructive dissipation can result from short circuit on amplifiers.

OPERATING CONDITIONS

| Symbol | Parameter | Value | Unit |
|-----------|---------------------------|------------------------------------|------|
| V_{CC} | Supply Voltage | ± 2.5 to ± 6 | V |
| V_{icm} | Common Mode Input Voltage | $(V_{CC}) + 2$ to $(V_{CC}^+) - 1$ | V |

APPLICATION: ADSL LINE INTERFACE

POWER DOWN EQUIVALENT SCHEMATIC**OUPUT IMPEDANCE IN POWER DOWN MODE**

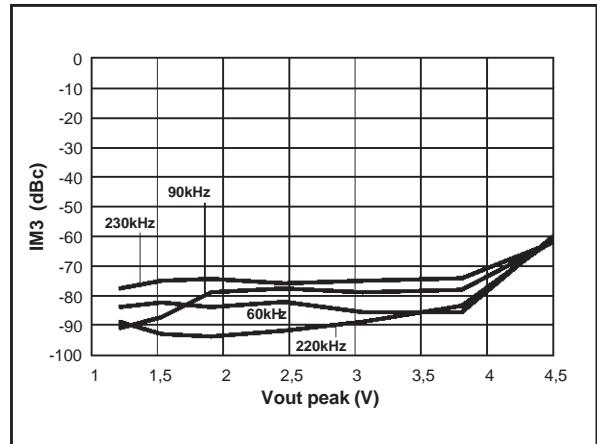

In Power Down Mode the output of the driver is in "high impedance" state. It is really the case for the static mode. Regarding the dynamic mode, the impedance decreases due to a capacitive effect of the collector-substrat and base collector junction. The impedance behaviour comes capacitive, typically: $1.4M\Omega // 33pF$.

INTERMODULATION DISTORTION

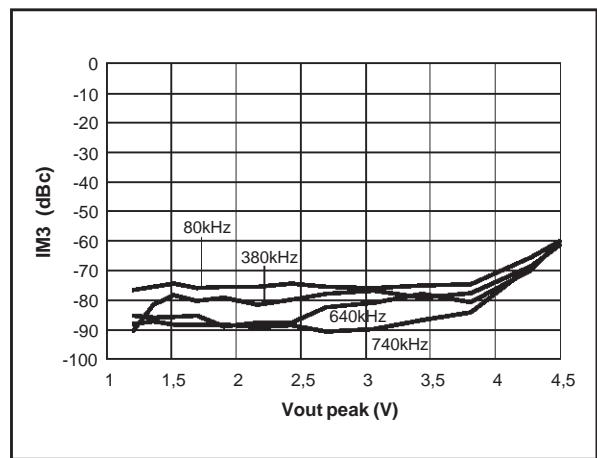

The curves shown below are the measurements results of a single operator wired as an adder with a gain of 15dB. The operational amplifier is supplied by a symmetric ± 6 V and is loaded with 25Ω . Two synthesizers (Rhode & Schwartz SME) generate two frequencies (tones) (70 & 80kHz or 180 & 280kHz). An HP3585 spectrum analyzer measures the spurious level at different frequencies. The curves are traced for different output levels (the value in the X axis is the value of each tone). The output levels of the two tones are the same. The generators and spectrum analyzer are phase locked to enhance measurement precision.

3rd ORDER INTERMODULATION

2 tones : 70kHz and 80kHz

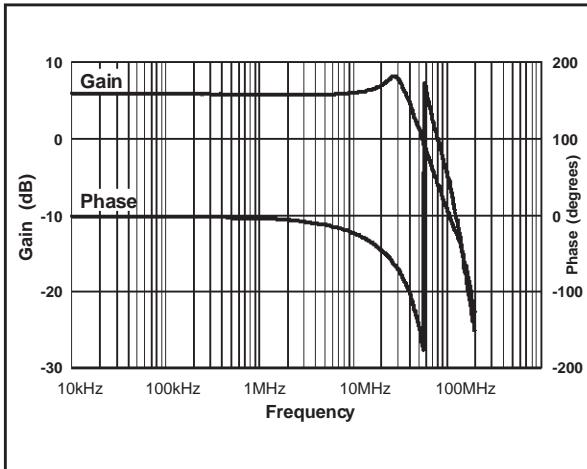

2 tones : 180kHz and 280kHz

Closed Loop Gain and Phase vs. Frequency

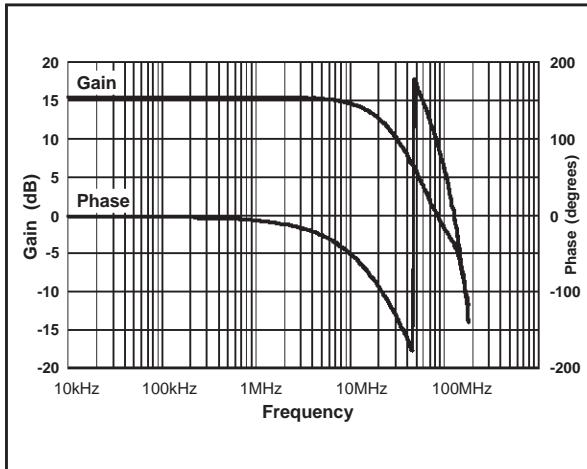

Gain=+2, Vcc=±6V, RL=25Ω

**Closed Loop Gain and Phase vs. Frequency**

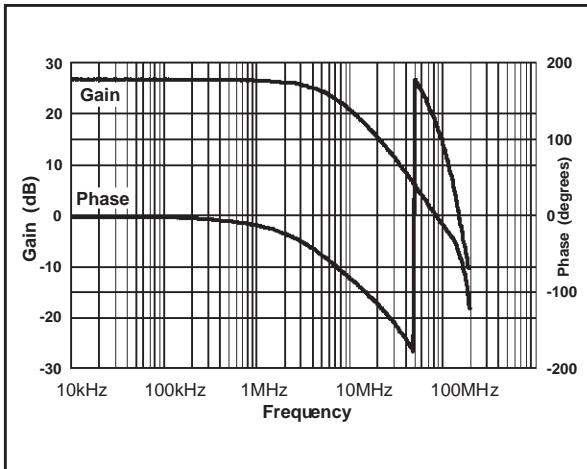

Gain=+6, Vcc=±6V, RL=25Ω

Closed Loop Gain and Phase vs. Frequency

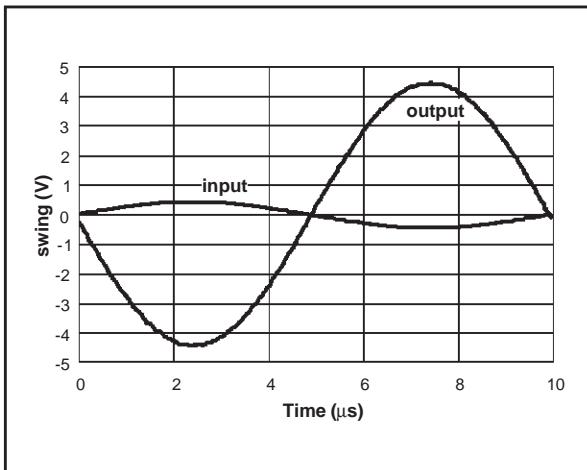

Gain=+6, Vcc=±6V, RL=25Ω

**Closed Loop Gain and Phase vs. Frequency**

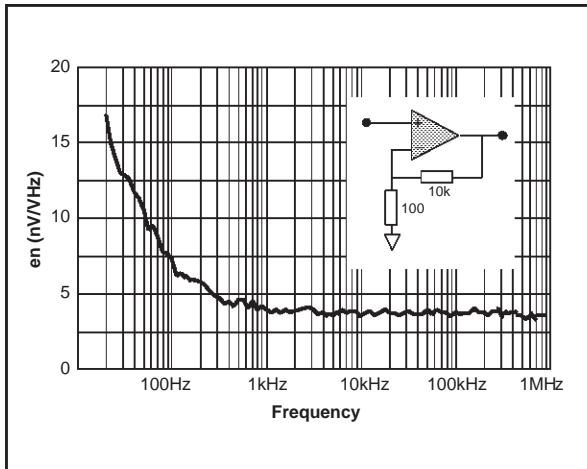

Gain=+11, Vcc=±6V, RL=25Ω

**Maximum Output Swing**

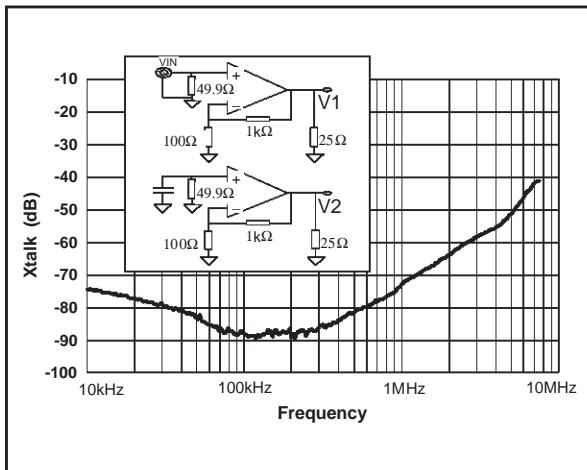

Vcc=±6V, RL=25Ω

**Equivalent Input Voltage Noise**

Gain=+100, Vcc=±6V, no load

**Channel Separation (Xtalk) vs. Frequency**

XTalk=20Log(V2/V1), Vcc=±6V, RL=25Ω

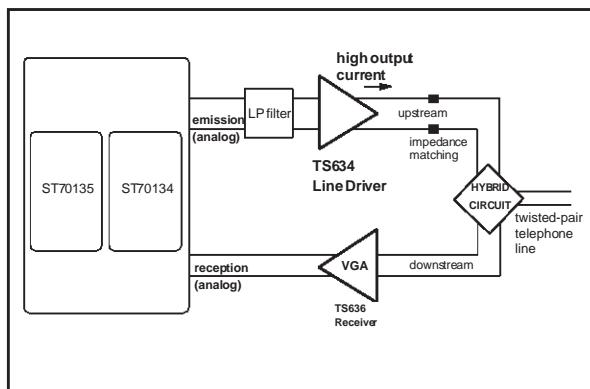

THE TS634 AS LINE DRIVER ON ADSL LINE INTERFACE. SINGLE SUPPLY IMPLEMENTATION WITH PASSIVE OR ACTIVE IMPEDANCE MATCHING.

THE LINE INTERFACE - ADSL Remote Terminal (RT):

The Figure1 shows a typical analog line interface used for ADSL service. On this note, the accent will be made on the emission path. The TS634 is used as a dual line driver for the upstream signal.

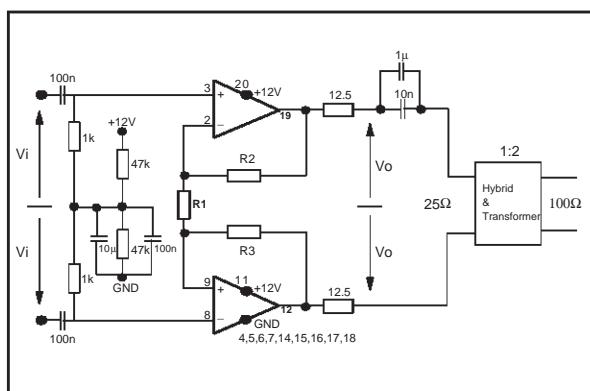

Figure 1 : Typical ADSL Line Interface

For the remote terminal it is required to create an ADSL modem easy to plug in a PC. In such an application, the driver should be implemented with a +12 volts single power supply. This +12V supply is available on PCI connector of purchase.

The Figure 2 shows a single +12V supply circuit that uses the TS634 as a remote terminal transmitter in differential mode.

Figure 2 : TS634 as a differential line driver with a +12V single supply

The driver is biased with a mid supply (nominally +6V), in order to maintain the DC component of the signal at +6V. This allows the maximum dv-

namic range between 0 and +12 V. Several options are possible to provide this bias supply (such as a virtual ground using an operational amplifier), such as a two-resistance divider which is the cheapest solution. A high resistance value is required to limit the current consumption. On the other hand, the current must be high enough to bias the inverting input of the TS634. If we consider this bias current ($5\mu\text{A}$) as the 1% of the current through the resistance divider ($500\mu\text{A}$) to keep a stable mid supply, two $47\text{k}\Omega$ resistances can be used.

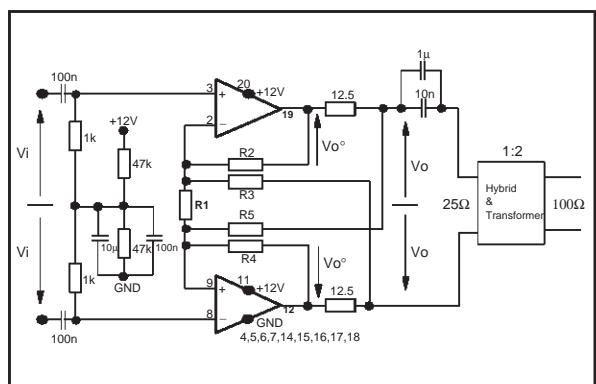

The input provides two high pass filters with a break frequency of about 1.6kHz which is necessary to remove the DC component of the input signal. To avoid DC current flowing in the primary of the transformer, an output capacitor is used. In this case the load impedance is 25Ω for each driver.

For the ADSL upstream path necessary to avoid any distortion. In this simple non-inverting amplification configuration, it will be easy to implement a Sallen-Key lowpass filter by using the TS634. For ADSL over POTS, a maximum frequency of 135kHz is reached. For ADSL over ISDN, the maximum frequency will be 276kHz.

INCREASING THE LINE LEVEL BY USING AN ACTIVE IMPEDANCE MATCHING

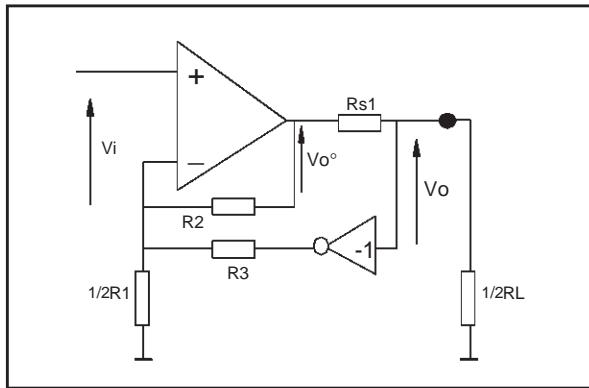

With passive matching, the output signal amplitude of the driver must be twice the amplitude on the load. To go beyond this limitation an active matching impedance can be used. With this technique it is possible to keep good impedance matching with an amplitude on the load higher than the half of the output driver amplitude. This concept is shown in Figure 3 for a differential line.

Figure 3 : TS634 as a differential line driver with an active impedance matching

Component calculation:

Let us consider the equivalent circuit for a single ended configuration, Figure 4.

Figure 4 : Single ended equivalent circuit

Let us consider the unloaded system. Assuming the currents through R_1 , R_2 and R_3 as respectively:

$$\frac{2Vi}{R_1}, \frac{(Vi - Vo^{\circ})}{R_2} \text{ and } \frac{(Vi + Vo)}{R_3}$$

As Vo° equals Vo without load, the gain in this case becomes :

$$G = \frac{Vo(noload)}{Vi} = \frac{1 + \frac{2R_2}{R_1} + \frac{R_2}{R_3}}{1 - \frac{R_2}{R_3}}$$

The gain, for the loaded system will be (1):

$$GL = \frac{Vo(withload)}{Vi} = \frac{1}{2} \frac{1 + \frac{2R_2}{R_1} + \frac{R_2}{R_3}}{1 - \frac{R_2}{R_3}}, (1)$$

As shown in figure5, this system is an ideal generator with a synthesized impedance as the internal impedance of the system. From this, the output voltage becomes:

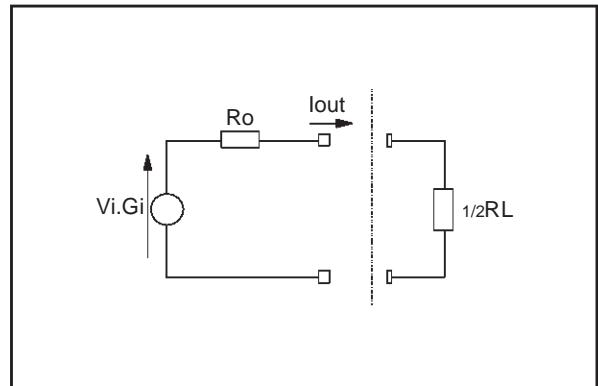

$$Vo = (ViG) - (RoIout), (2)$$

with Ro the synthesized impedance and $Iout$ the output current. On the other hand Vo can be expressed as:

$$Vo = \frac{Vi \left(1 + \frac{2R_2}{R_1} + \frac{R_2}{R_3} \right)}{1 - \frac{R_2}{R_3}} - \frac{Rs1Iout}{1 - \frac{R_2}{R_3}}, (3)$$

By identification of both equations (2) and (3), the synthesized impedance is, with $Rs1=Rs2=Rs$:

$$Ro = \frac{Rs}{1 - \frac{R_2}{R_3}}, (4)$$

Figure 5 : Equivalent schematic. Ro is the synthesized impedance

Unlike the level Vo° required for a passive impedance, Vo° will be smaller than $2Vo$ in our case. Let us write $Vo^{\circ}=kVo$ with k the matching factor varying between 1 and 2. Assuming that the current through R_3 is negligible, it comes the following resistance divider:

$$Ro = \frac{kVoRL}{RL + 2Rs1}$$

After choosing the k factor, Rs will equal to $1/2RL(k-1)$.

A good impedance matching assumes:

$$Ro = \frac{1}{2}RL, (5)$$

From (4) and (5) it becomes:

$$\frac{R_2}{R_3} = 1 - \frac{2Rs}{RL}, (6)$$

By fixing an arbitrary value for R_2 , (6) gives:

$$R_3 = \frac{R_2}{1 - \frac{2Rs}{RL}}$$

Finally, the values of R_2 and R_3 allow us to extract R_1 from (1), and it comes:

$$R_1 = \frac{2R_2}{2 \left(1 - \frac{R_2}{R_3} \right) GL - 1 - \frac{R_2}{R_3}}, (7)$$

with GL the required gain.

| | |
|---------------------------------|--|
| GL (gain for the loaded system) | GL is fixed for the application requirements $GL=Vo/Vi=0.5(1+2R2/R1+R2/R3)/(1-R2/R3)$ |
| R1 | $2R2/[2(1-R2/R3)GL-1-R2/R3]$ |
| R2 (=R4) | Arbitrary fixed |
| R3 (=R5) | $R2/(1-Rs/0.5RL)$ |
| Rs | $0.5RL(k-1)$ |

CAPABILITIES

The table below shows the calculated components for different values of k . In this case $R_2=1000\Omega$ and the gain=16dB. The last column displays the maximum amplitude level on the line regarding the TS634 maximum output capabilities (18Vpp diff.) and a 1:2 line transformer ratio.

| Active matching | | | | TS634 Output Level to get 12.4Vpp on the line (Vpp diff) | Maximum Line level (Vpp diff) |
|------------------|--------------------|--------------------|--------------------|--|-------------------------------|
| k | R_1 (Ω) | R_3 (Ω) | R_s (Ω) | | |
| 1.3 | 820 | 1500 | 3.9 | 8 | 27.5 |
| 1.4 | 490 | 1600 | 5.1 | 8.7 | 25.7 |
| 1.5 | 360 | 2200 | 6.2 | 9.3 | 25.3 |
| 1.6 | 270 | 2400 | 7.5 | 9.9 | 23.7 |
| 1.7 | 240 | 3300 | 9.1 | 10.5 | 22.3 |
| Passive matching | | | | 12.4 | 18 |

MEASUREMENT OF THE POWER CONSUMPTION

Conditions:

Power Supply: 12V

Passive impedance matching

Transformer turns ratio: 2

Maximun level required on the line: 12.4Vpp

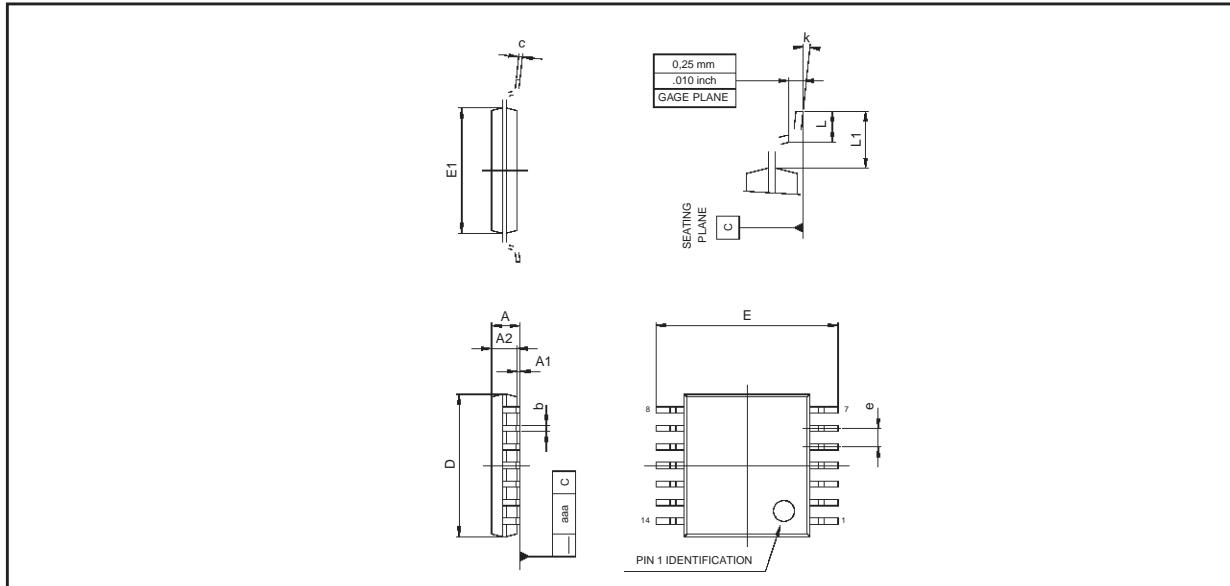

Maximum output level of the driver: 12.4Vpp

Crest factor: 5.3 (Vp/Vrms)

The TS634 power consumption during emission on 900 and 4550 meter twisted pair telephone lines: **450mW**
