

5-V Low-Drop Fixed Voltage Regulator

TLE 4278 G

Features

- Output voltage tolerance $\leq \pm 2\%$
- Very low current consumption
- Separated reset and watchdog output
- Low-drop voltage
- Watchdog
- Adjustable watchdog activating threshold
- Adjustable reset threshold
- Overtemperature protection
- Reverse polarity protection
- Short-circuit proof
- Suitable for use in automotive electronics
- Wide temperature range

| Type | Ordering Code | Package |
|------------|---------------|------------------|
| TLE 4278 G | Q67006-A9291 | P-DSO-14-8 (SMD) |

Functional Description

The TLE 4278 is a monolithic integrated low-drop fixed-voltage regulator which can supply loads up to 200 mA. The device is available in the P-DSO-14-8 package. It is designed to supply microprocessor systems under the severe conditions of automotive applications and therefore equipped with additional protection functions against over load, short circuit and overtemperature. Of course the TLE 4278 can also be used in other applications where a stabilized voltage is required.

An input voltage V_I in the range of $5.5 \text{ V} \leq V_I \leq 45 \text{ V}$ is regulated to $V_{Q,nom} = 5 \text{ V}$ with an accuracy of $\pm 2\%$.

The device operates in the wide temperature range of $T_j = -40$ to 150°C .

Two additional features are implemented in the TLE 4278 a load dependent watchdog function as well as a sophisticated reset function including power on reset, under voltage reset, adjustable reset delay time and adjustable reset switching threshold.

The watchdog function monitors the microcontroller, including time base failures. In case of a missing rising edge within a certain pulse repetition time the watchdog output is set to LOW. Programming of the max. repetition time can be done easily by an external reset

delay capacitor. To prevent a reset in case of missing pulses, the watchdog output WO is separate from the reset output RO for the TLE 4278. The watchdog output can be used as an interrupt signal for the microcontroller. In any case it is possible to connect pin WO and pin RO externally.

When the controller is set to sleep mode or low power mode its current consumption drops and no watchdog pulses are created. In order to avoid unnecessary wake up signals due to missing pulses at pin WI the watchdog feature can be disabled as a function of the load current. The switch off threshold is set by an external resistor to pin WADJ. The watchdog function can also be used as a timer, which periodically wakes up the controller. Therefore the pin WADJ has to be connected to the output Q.

The power on reset feature is necessary for a defined start of the microprocessor when switching on the application. The reset signal at pin RO goes high after a certain delay timed t_{rd} when the output voltage of the regulator has surpassed the reset threshold. The delay time is set by the external delay capacitor. An under voltage reset circuit supervises the output voltage. In case V_Q falls below the reset threshold the reset output is set to LOW after a short reset reaction time t_{rr} . The reset LOW signal is generated down to an output voltage V_Q of 1 V. In addition the reset switching threshold can be adjusted by an external voltage divider. This feature is useful with microprocessors which guarantee a safe operation down to voltages below the internally set reset threshold of 4.65 V typical.

Figure 1 Pin Configuration (top view)

Pin Definitions and Functions

| Pin | Symbol | Function |
|------------------------|--------|---|
| 1 | WO | Watchdog Output ; the open collector output is connected to the 5 V output via an integrated resistor of 30 k Ω . |
| 2 | WADJ | Watchdog Adjust ; an external resistor to GND determines the watchdog activating threshold. |
| 3, 4, 5, 10, 11, 12 | GND | Ground |
| 6 | D | Reset Delay ; connect a capacitor to ground for delay time adjustment. |
| 7 | RADJ | Reset Switching Threshold Adjust ; for setting the switching threshold, connect a voltage divider from output to ground. If this input is connected to ground, the reset is triggered at the internal threshold. |
| 8 | WI | Watchdog Input ; rising edge-triggered input for monitoring a microcontroller. |
| 9 | Q | 5 V Output Voltage ; block to ground with min. 10 μ F capacitor, $ESR \leq 5 \Omega$. |
| 13 | I | Input Voltage ; block to ground directly on the IC with ceramic capacitor. |
| 14 | RO | Reset Output ; the open collector output is connected to the 5 V output via an integrated resistor of 30 k Ω . |

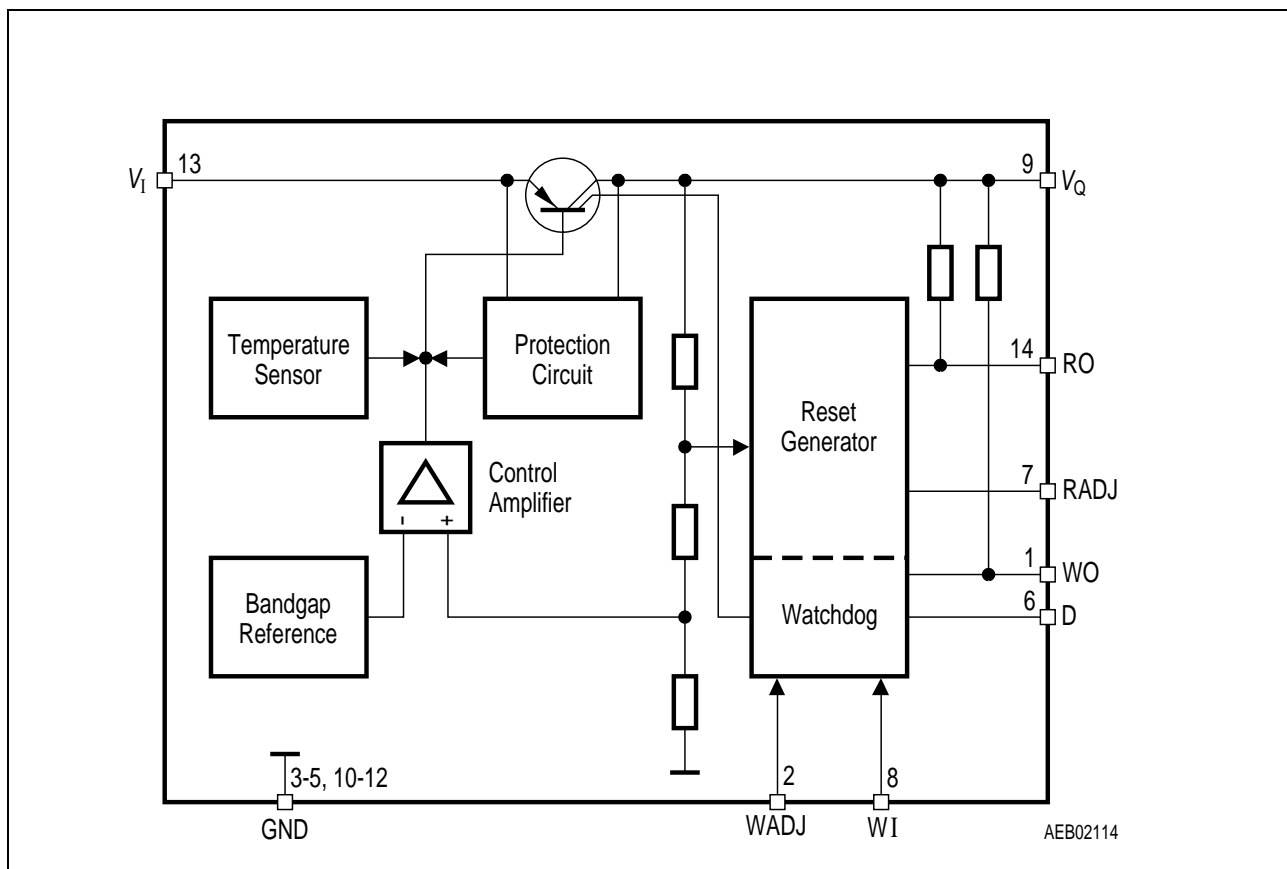

Figure 2 **Block Diagram**

Absolute Maximum Ratings

 $T_j = -40 \text{ to } 150 \text{ }^{\circ}\text{C}$

| Parameter | Symbol | Limit Values | | Unit | Notes |
|-----------|--------|--------------|------|------|-------|
| | | min. | max. | | |

Input Voltage I

| | | | | | |
|---------|-------|------|----|----|--------------------|
| Voltage | V_I | - 42 | 45 | V | – |
| Current | I_I | – | – | mA | Internally limited |

Output Voltage Q

| | | | | | |
|---------|-------|-----|----|----|--------------------|
| Voltage | V_Q | - 1 | 25 | V | – |
| Current | I_Q | – | – | mA | Internally limited |

Reset Output RO

| | | | | | |
|---------|----------|-------|----|----|---|
| Voltage | V_{RO} | - 0.3 | 25 | V | – |
| Current | I_{RO} | - 5 | 5 | mA | – |

Reset Delay D

| | | | | | |
|---------|-------|-------|---|----|---|
| Voltage | V_D | - 0.3 | 7 | V | – |
| Current | I_D | - 2 | 2 | mA | – |

Reset Switching Threshold Adjust RADJ

| | | | | | |
|---------|------------|-------|---|----|--------------------|
| Voltage | V_{RADJ} | - 0.3 | 7 | V | – |
| Current | I_{RADJ} | – | – | mA | Internally limited |

Watchdog Input WI

| | | | | | |
|---------|----------|-------|---|----|--------------------|
| Voltage | V_{WI} | - 0.3 | 7 | V | – |
| Current | I_{WI} | – | – | mA | Internally limited |

Watchdog Output WO

| | | | | | |
|---------|----------|-------|----|----|---|
| Voltage | V_{WO} | - 0.3 | 25 | V | – |
| Current | I_{WO} | - 5 | 5 | mA | – |

Absolute Maximum Ratings (cont'd)
 $T_j = -40 \text{ to } 150 \text{ }^{\circ}\text{C}$

| Parameter | Symbol | Limit Values | | Unit | Notes |
|-----------|--------|--------------|------|------|-------|
| | | min. | max. | | |

Watchdog Adjust WADJ

| | | | | | |
|---------|-------------------|-------|---|----|--------------------|
| Voltage | V_{WADJ} | - 0.3 | 7 | V | - |
| Current | I_{WADJ} | - | - | mA | Internally limited |

Ground GND

| | | | | | |
|---------|------------------|-------|----|----|---|
| Current | I_{GND} | - 100 | 50 | mA | - |
|---------|------------------|-------|----|----|---|

Temperatures

| | | | | | |
|----------------------|------------------|------|-----|--------------------|---|
| Junction temperature | T_j | - 50 | 150 | $^{\circ}\text{C}$ | - |
| Storage temperature | T_{stg} | - 50 | 150 | $^{\circ}\text{C}$ | - |

Note: ESD protection according to MIL Std. 883: $\pm 2 \text{ kV}$.

Maximum ratings are absolute ratings; exceeding any one of these values may cause irreversible damage to the integrated circuit.

Operating Range

| Parameter | Symbol | Limit Values | | Unit | Notes |
|----------------------|--------|--------------|------|--------------------|-------|
| | | min. | max. | | |
| Input voltage | V_I | 5.5 | 45 | V | - |
| Junction temperature | T_j | - 40 | 150 | $^{\circ}\text{C}$ | - |

Thermal Resistance

| | | | | | |
|------------------|----------------------|---|----|-----|-------------------|
| Junction ambient | $R_{\text{thj-a}}$ | - | 80 | K/W | ¹⁾ |
| Junction pin | $R_{\text{thj-pin}}$ | - | 30 | K/W | Measured to pin 4 |

¹⁾ Package mounted on PCB $80 \times 80 \times 1.5 \text{ mm}^3$; $35\mu\text{Cu}$; $5\mu\text{Sn}$; Heat Sink Area 6 cm^2 ; zero airflow.

Note: In the operating range the functions given in the circuit description are fulfilled.

Electrical Characteristics

$V_I = 13.5 \text{ V}$; $-40 \text{ }^\circ\text{C} \leq T_j \leq 125 \text{ }^\circ\text{C}$ (unless otherwise specified)

| Parameter | Symbol | Limit Values | | | Unit | Test Condition |
|--|-------------------|--------------|------|------|---------------|---|
| | | min. | typ. | max. | | |
| Output voltage | V_Q | 4.90 | 5.00 | 5.10 | V | $0 \text{ mA} \leq I_Q \leq 150 \text{ mA}$; $6 \text{ V} \leq V_I \leq 28 \text{ V}$ |
| Output voltage | V_Q | 4.8 | 5.0 | 5.2 | V | $1 \text{ mA} \leq I_Q \leq 50 \text{ mA}$; $28 \text{ V} \leq V_I \leq 45 \text{ V}$ |
| Output current limiting | I_Q | 200 | 400 | – | mA | $V_Q = 4.8 \text{ V}$ |
| Current consumption $I_q = I_I - I_Q$ | $I_{q,o}$ | – | 180 | 200 | μA | $T_j = 25 \text{ }^\circ\text{C}$; $I_Q = 0 \text{ mA}$ |
| Current consumption $I_q = I_I - I_Q$ | $I_{q,o}$ | – | 210 | 230 | μA | $I_Q = 0 \text{ mA}$; $T_j = 85 \text{ }^\circ\text{C}$ |
| Current consumption $I_q = I_I - I_Q$ | $I_{q,150}$ | – | 5 | 12 | mA | $I_Q = 150 \text{ mA}$ |
| Drop voltage; $V_{DR} = V_I - V_Q$ | V_{dr} | – | 0.25 | 0.5 | V | $I_Q = 150 \text{ mA}^{1)}$ |

| Lower watchdog timing threshold | V_{DWL} | 0.5 | 0.7 | 0.9 | V | – |
| Watchdog output pulse period | $T_{WD,p}$ | 42 | 60 | 80 | ms | $C_d = 47 \text{ nF}$ |
| Watchdog output low time | $t_{WD,l}$ | 7 | 13 | 19 | ms | $V_Q > V_{RT}$ |
| Watchdog trigger time | $T_{WI,tr}$ | 35 | 47 | 61 | ms | $C_d = 47 \text{ nF}$ |

¹⁾ Measured when the output voltage V_Q has dropped 100 mV from the nominal value.

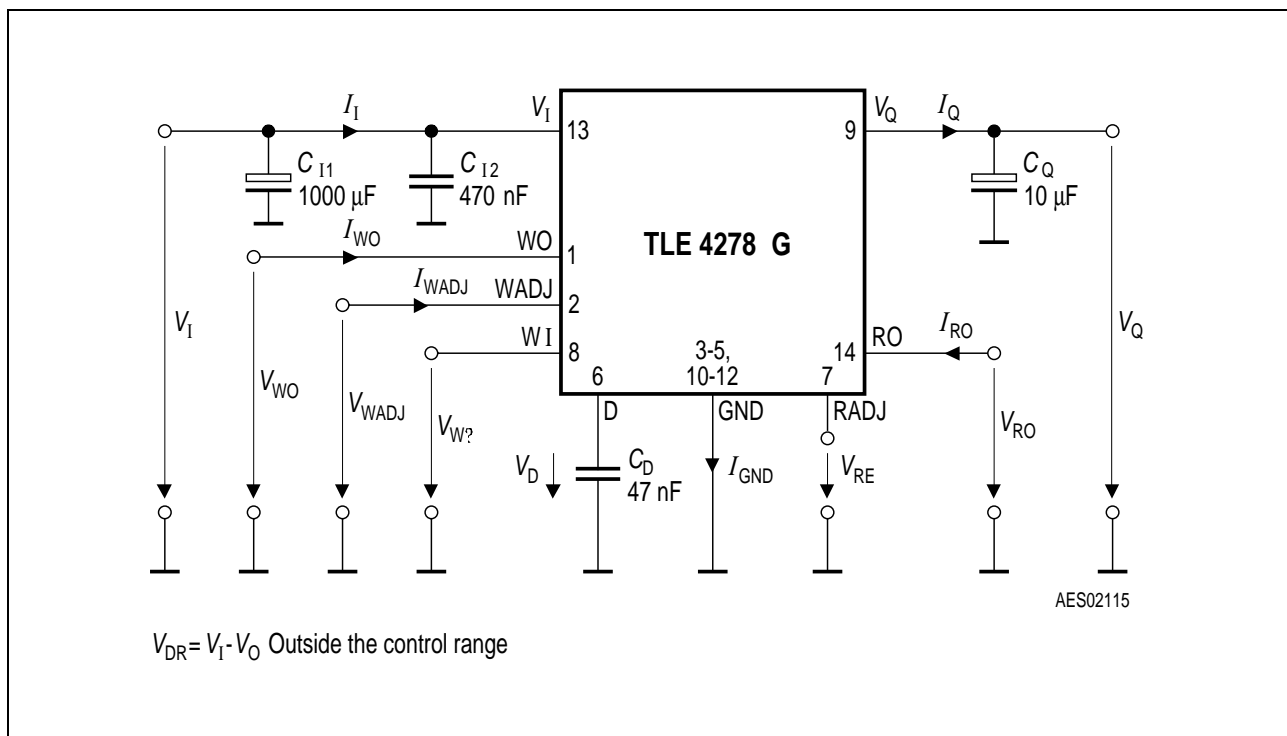

Figure 3 **Test Circuit**

Application Information

Input, Output

The input capacitors C_{I1} and C_{I2} are necessary for compensating line influences. Using a resistor of approx. $1\ \Omega$ in series with C_{I1} , the LC circuit of input inductance and input capacitance can be damped. To stabilize the regulation circuit the output capacitor C_Q is necessary. Stability is guaranteed at values $C_Q \geq 10\ \mu\text{F}$ with an $\text{ESR} \leq 5\ \Omega$ within the operating temperature range.

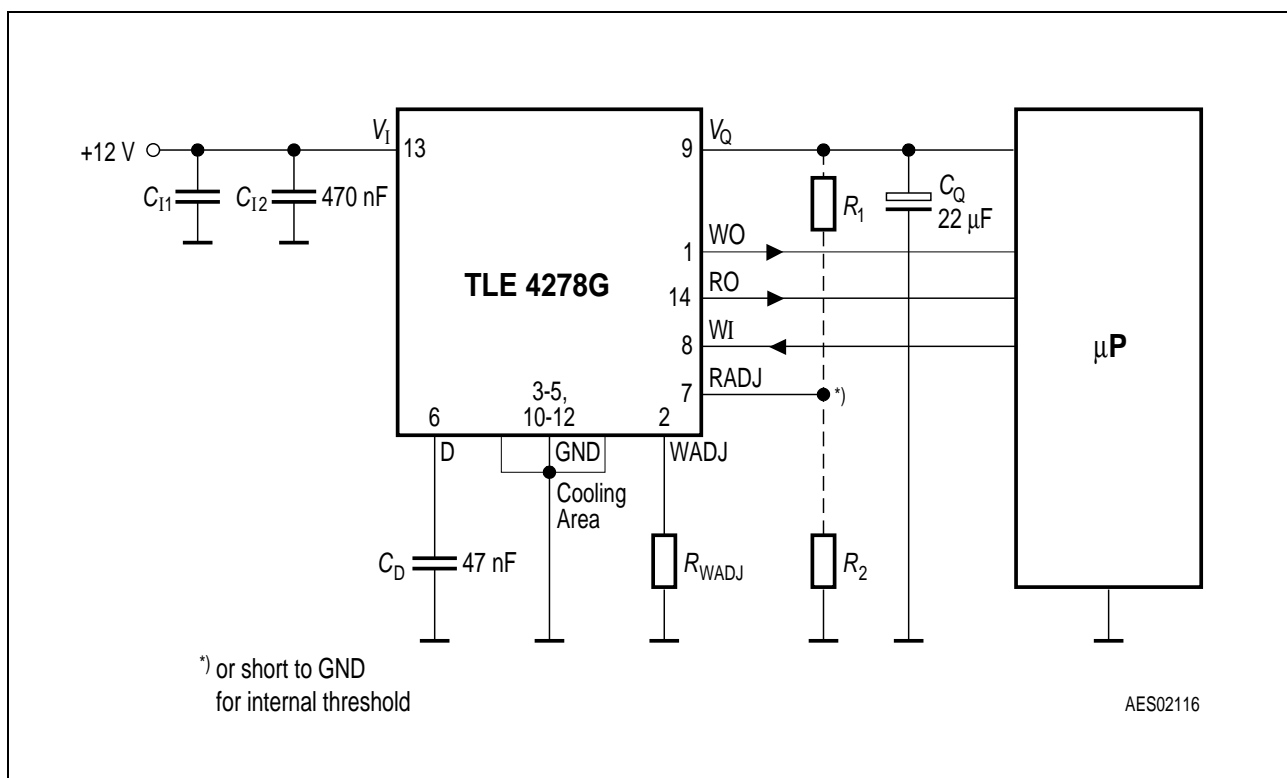

Figure 4 Application Circuit

Reset Timing

The power-on reset delay time is defined by the charging time of an external capacitor C_D which can be calculated as follows:

$$C_D = (\Delta t_{rd} \times I_{D,c})/\Delta V$$

Definitions: C_D = delay capacitor

 Δt_{rd} = delay time $I_{D.C.}$ = charge current, typical 5 μ A
$$\Delta V = V_{DU}, \text{ typical } 1.9 \text{ V}$$

V_{DU} = upper delay switching threshold at C_D for reset delay time

The reset reaction time t_{rr} is the time it takes the voltage regulator to set the reset out LOW after the output voltage has dropped below the reset threshold. It is typically 1 μ s for delay capacitor of 47 nF. For other values for C_D the reaction time can be estimated using the following equation:

$$t_{rr} \approx 20 \text{ s/F} \times C_D$$

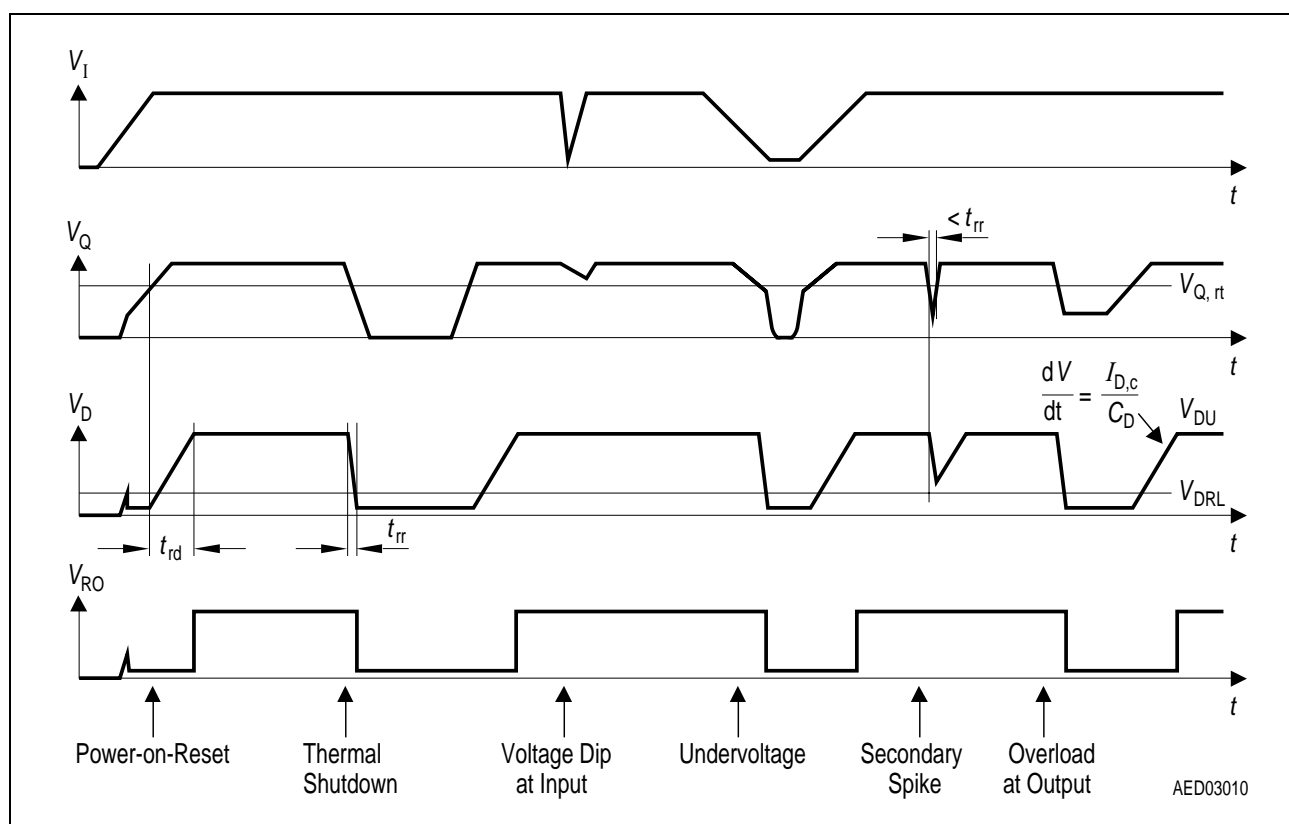

Figure 5 Reset Timing (Watchdog Disabled)

Reset Switching Threshold

The present default value is 4.65 V. When using the TLE 4278 the reset threshold can be set to $3.5\text{ V} < V_{Q,rt} < 4.6\text{ V}$ by connecting an external voltage divider to pin RADJ. The calculation can be easily done since the reset adjust input current can be neglected. If this feature is not needed, the pin has to be connected to GND.

$$V_{Q,rt} = V_{ref}(1 + R_1/R_2)$$

Definitions: $V_{Q,rt}$ = Reset threshold

V_{ref} = comparator reference voltage, typical 1.35 V

(Reset adjust input current $\approx 50\text{ nA}$)

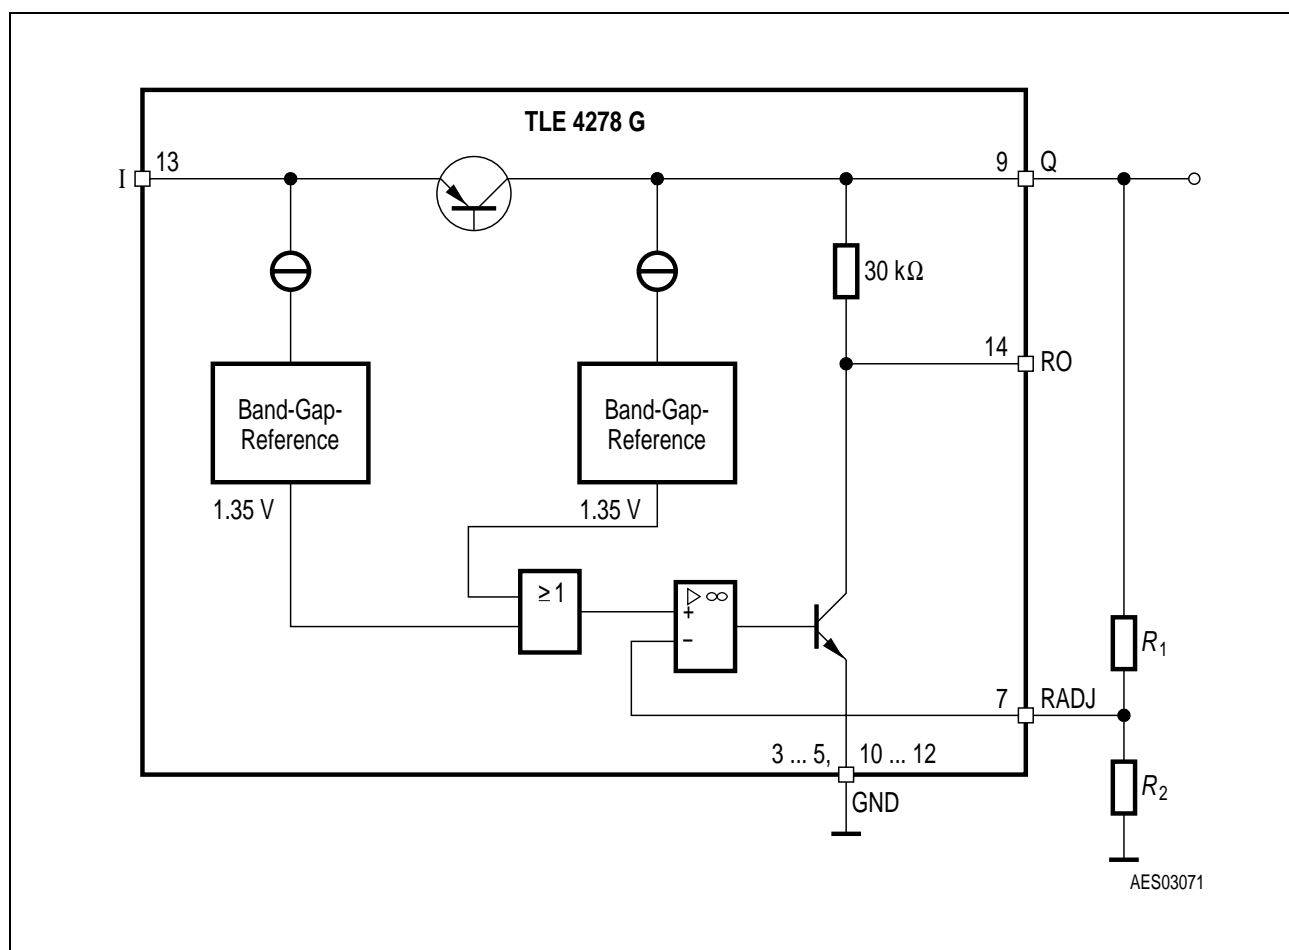

Figure 6

The reset output pin is internally connected to the 5 V output Q via a 30 kΩ pull-up resistor. Down to an output voltage V_Q of typical 1 V the reset LOW signal at pin RO is generated.

For the timing of the reset feature please refer to the data sheet, **Figure 5**.

Watchdog Activating

The calculation of the external resistor which adjusts the watchdog switch off threshold can be done by the following equation.

$$R_{WADJ} = V_{WADJ,th} \times (I_Q/I_{WADJ})/I_{Q,act}$$

Definitions: $V_{WADJ,th}$ = switch off threshold, typical 1.35 V

I_Q/I_{WADJ} = current ratio, typical 720

$I_{Q,act}$ = switch off load current

Figure 7

Watchdog Timing

The frequency of the watchdog pulses has to be higher than the minimum pulse sequence which is set by the external reset delay capacitor C_D . Calculation can be done according to the formulas given in **Figure 8**.

The watchdog output is internally connected to the output Q via a 30 kΩ pull-up resistor. To generate a watchdog created reset signal for the microcontroller the pin WO can be connected to the reset input of the microcontroller. It is also allowed to parallel the watchdog out to the reset out.

Figure 8 Timing of the Watchdog Function

Hints for Unused Pins

| Symbol | Function | Connect to |
|---------------|----------------------------------|---|
| RO | Reset output | open |
| D | Reset delay | open or to output Q |
| RADJ | Reset switching threshold adjust | GND |
| WI | Watchdog input | GND |
| WO | Watchdog output | open |
| WADJ | Watchdog adjust | ¹⁾ to output Q via a 270 k Ω resistor: Watchdog always active ²⁾ to GND: Watchdog disabled |
