

## 5-V Low-Drop Voltage Regulator

**TLE 4267**

**Bipolar IC**

### Features

- Output voltage tolerance  $\leq \pm 2 \%$
- 400 mA output current capability
- Low-drop voltage
- Very low standby current consumption
- Input voltage up to 40 V
- Overvoltage protection up to 60 V ( $\leq 400$  ms)
- Reset function down to 1 V output voltage
- ESD protection up to 2000 V
- Adjustable reset time
- On/off logic
- Overtemperature protection
- Reverse polarity protection
- Short-circuit proof
- Wide temperature range
- Suitable for use in automotive electronics

Type	Ordering Code	Package

■ SMD type

### Functional Description

TLE 4267 is a 5-V low-drop voltage regulator for automotive applications in the TO220-7 or DSO-14 package. It supplies an output current of  $> 400$  mA. The IC is shortcircuit-proof and has an overtemperature protection circuit.

## Application

The IC regulates an input voltage  $V_i$  in the range of  $5.5\text{ V} < V_i < 40\text{ V}$  to a nominal output voltage of  $V_o = 5.0\text{ V}$ . A reset signal is generated for an output voltage of  $V_o < V_{RT}$  (typ.  $4.5\text{ V}$ ). The reset delay can be set with an external capacitor. The device has two logic inputs. A voltage of  $V_{E2} > 4.0\text{ V}$  given to the E2-pin (e.g. by ignition) turns the device on. Depending on the voltage on pin E6 the IC may be hold in active-state even if  $V_{E2}$  goes to low level. This makes it simple to implement a self-holding circuit without external components. When the device is turned off, the output voltage drops to  $0\text{ V}$  and current consumption tends towards  $0\text{ }\mu\text{A}$ .

## Design Notes for External Components

The input capacitor  $C_i$  is necessary for compensation of line influences. The resonant circuit consisting of lead inductance and input capacitance can be damped by a resistor of approx.  $1\text{ }\Omega$  in series with  $C_i$ . The output capacitor is necessary for the stability of the regulating circuit. Stability is guaranteed at values of  $\geq 22\text{ }\mu\text{F}$  and an ESR of  $\leq 3\text{ }\Omega$  within the operating temperature range.

## Circuit Description

The control amplifier compares a reference voltage, which is kept highly accurate by resistance adjustment, to a voltage that is proportional to the output voltage and drives the base of the series transistor via a buffer. Saturation control as a function of the load current prevents any over-saturating of the power element.

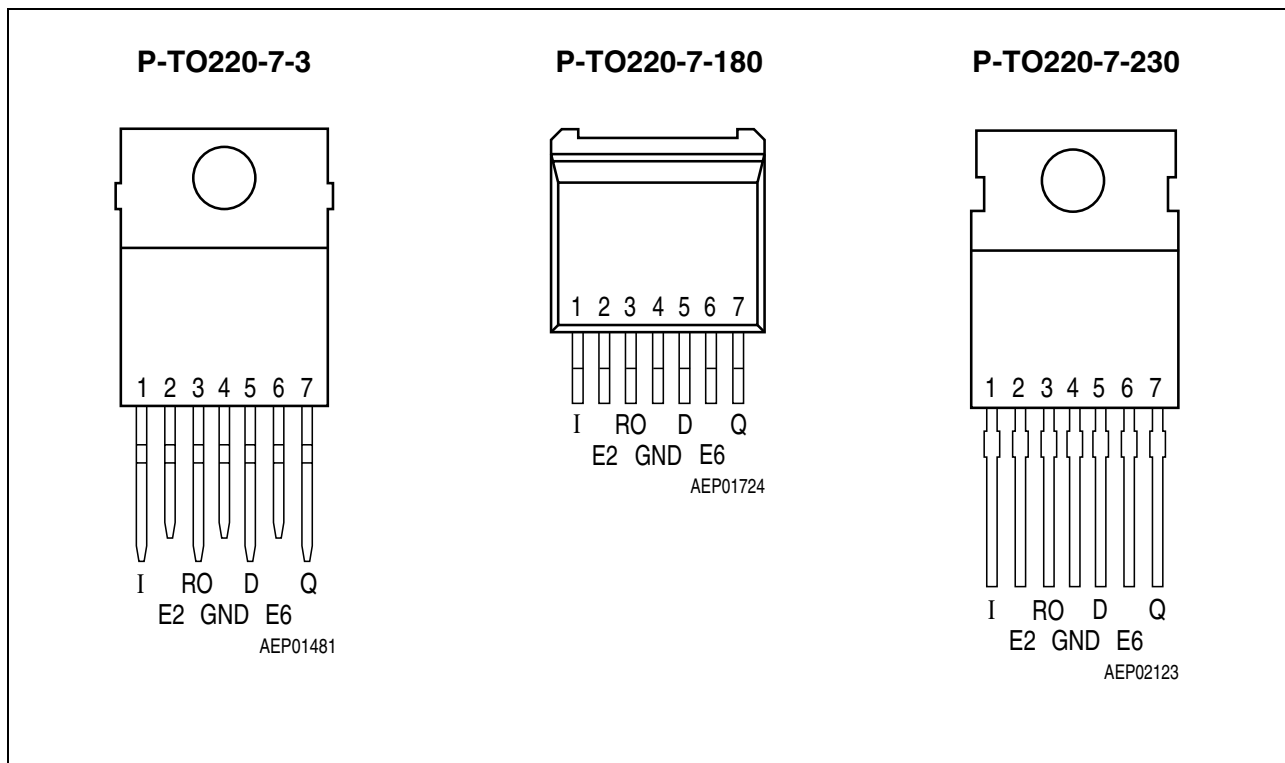

The reset output RO is in high-state if the voltage on the delay capacitor  $C_D$  is greater or equal  $V_{UD}$ . The delay capacitance  $C_D$  is charged with the current  $I_D$  for output voltages greater than the reset threshold  $V_{RT}$ . If the output voltage gets lower than  $V_{RT}$  a fast discharge of the delay capacitor  $C_D$  sets in and as soon as  $V_{CD}$  gets lower than  $V_{LD}$  the reset output RO is set to low-level (see **Figure 6**). The reset delay can be set within wide range by dimensioning the capacitance of the external capacitor.

**Truth Table for Turn-ON/Turn-OFF Logic**

<b>E2, Inhibit</b>	<b>E6, Hold</b>	<b><math>V_Q</math></b>	<b>Remarks</b>
L	X	OFF	Initial state, Inhibit internally pulled up
H	X	ON	Regulator switched on via Inhibit, by ignition for example
H	L	ON	Hold clamped active to ground by controller while Inhibit is still high
X	L	ON	Previous state remains, even ignition is shut off: self-holding state
L	L	ON	Ignition shut off while regulator is in self-holding state
L	H	OFF	Regulator shut down by releasing of Hold while Inhibit remains Low, final state. No active clamping required by external self-holding circuit ( $\mu C$ ) to keep regulator in off-state.

Inhibit: E2 Enable function, active High

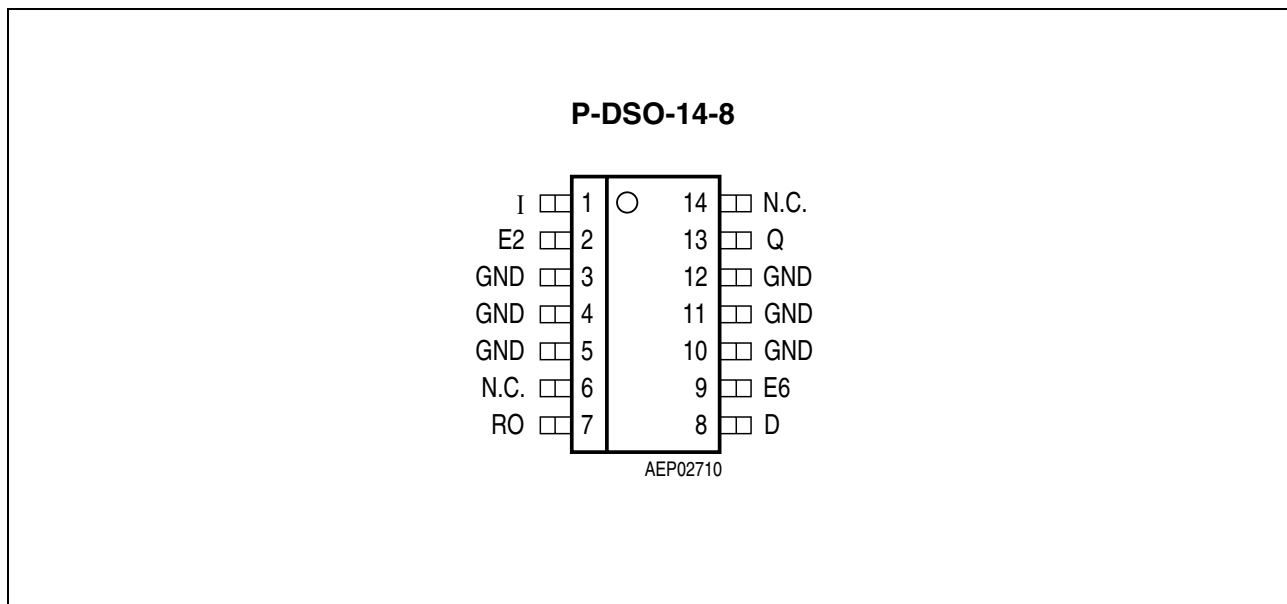

Hold: E6 Hold and release function, active Low

**Figure 1** Pin Configuration (top view)

### Pin Definitions and Functions

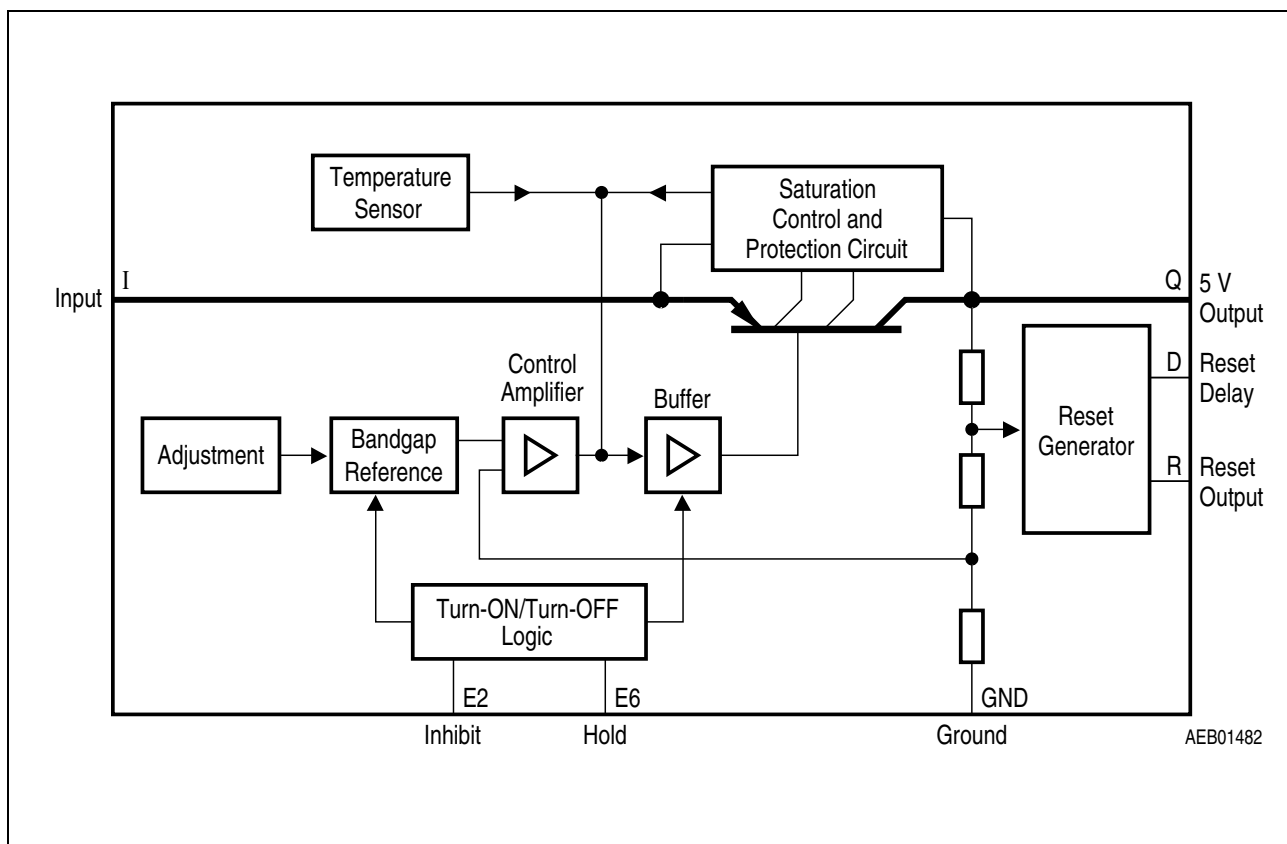

Pin	Symbol	Function
1	I	<b>Input;</b> block to ground directly at the IC by a ceramic capacitor
2	E2	<b>Inhibit;</b> device is turned on by High signal on this pin; internal pulldown resistor of 100 k $\Omega$
3	RO	<b>Reset Output;</b> open-collector output internally connected to the output via a resistor of 30 k $\Omega$
4	GND	<b>Ground;</b> connected to rear of chip
5	D	<b>Reset Delay;</b> connect via capacitor to GND
6	E6	<b>Hold;</b> see truth table above for function; this input is connected to output voltage via a pull up resistor of 50 k $\Omega$
7	Q	<b>5-V Output;</b> block to GND with 22- $\mu$ F capacitor, ESR < 3 $\Omega$

**Figure 2** Pin Configuration (top view) (cont'd)

### Pin Definitions and Functions

Pin	Symbol	Function
1	I	<b>Input;</b> block to ground directly at the IC by a ceramic capacitor
2	E2	<b>Inhibit;</b> device is turned on by High signal on this pin; internal pulldown resistor of 100 k $\Omega$
7	RO	<b>Reset Output;</b> open-collector output internally connected to the output via a resistor of 30 k $\Omega$
3, 4, 5, 10, 11, 12	GND	<b>Ground;</b> connected to rear of chip
8	D	<b>Reset Delay;</b> connect with capacitor to GND for setting delay
9	E6	<b>Hold;</b> see truth table above for function; this input is connected to output voltage via a pull up resistor of 50 k $\Omega$
13	Q	<b>5-V Output;</b> block to GND with 22- $\mu$ F capacitor, ESR $\leq$ 3 $\Omega$
6, 14	N.C.	<b>Not Connected</b>
