

TMC2011A/2111A

Variable-Length Shift Register

Features

- · Low power CMOS
- TMC2011A is a pin compatible replacement for the TDC1011 and TMC2011
- TMC2211A is a pin compatible replacement for the TMC2111
- · Inputs and outputs are TTL compatible
- DC-40MHz clock rate
- Selectable delay lengths (TMC2011A: 3 to 18 stages, TMC2111A: 1 to 16 stages)
- Special 4-bit wide mixed-delay mode (TMC2011A)
- Available in 24-pin CERDIP and plastic DIP and 28-lead Plastic Leadless Chip Carrier

Applications

- · Video filtering
- · High speed data registers
- Local storage registers
- · Digital delay lines
- · Television special effects
- · Pipeline register

Description

The TMC2011A and TMC2111A are high-speed, byte-wide shift registers with programmable delay lengths.

The TMC2011A can be programmed to any length between 3 and 18 stages. It offers a special split-word mode which allows for mixed delay lengths. The TMC2011A, constructed in low-power CMOS, is pin and function compatible with the bipolar TDC1011.

The TMC2111A is a byte-wide shift register that can be programmed to lengths of 1 to 16 stages.

The TMC2011A and TMC2111A are fully synchronous, with all operations controlled by a single master clock. Input and output registers are positive-edge triggered D-type flipflops. The length and mode controls are also registered. Both devices operate with a maximum clock rate of 40 MHz.

Fabricated in a submicron CMOS process, the TMC2011A and TMC2111A are TTL-compatible, and are available in 24-pin CERDIP and Plastic DIP packages as well as a 28-lead Plastic Leadless Chip Carrier.

Block Diagrams

TMC2011A

TMC2111A

Functional Description

The TMC2011A consists of two 4-bit wide, programmable length shift registers. The TMC2111A consists of a single 8-bit wide, programmable length shift register. The internal

registers of each device share control signals and a common clock.

Pin Descriptions - TMC2011A

	Pin N	umber	
Pin Name	DIP	PLCC	Pin Function Description
Power		•	
V _{DD}	7	8	Supply Voltage. The TMC2011A and operates from a single +5V supply. All power and ground lines must be connected.
GND	18	21,22	Ground. The TMC2011A operates from a single +5V supply. All power and ground lines must be connected.
Data Inputs	S	•	
DI ₇₋₀	12,11,10, 9,4,3,2,1	14,13,12, 10,5,4,3,2	Data Input. Eight inputs are provided for the data, which pass through the shift register unchanged. The eight inputs on the TMC2011A are divided into two groups of four bits to allow mixed delay operation. The lengths of these two groups are different when the Mode Control (MC) is HIGH (see Table 1). When MC is LOW both groups have equal delays.
Data Outpu	ıts	•	
DO7-0	13,14,15, 16,21,22, 23,24	15,16,17, 18,26,27, 28,1	Data Output. The outputs of the shift register are delayed relative to the input signals. The amount of the delay is programmable (see Table 1). The outputs remain valid for a minimum of tho nanoseconds after the leading edge of CLK. This allow the data to be latched into circuits with non-zero hold time requirements.
Controls		•	
CLK	8	9	Master Clock. All inputs and outputs are synchronous and operate from a single master clock. All operations occur on the rising edge of the master clock.
L ₃₋₀	19,20,6,5	23,24,7,6	Length Select. The length select input is used to determine the register delay of the TMC2011A. This input is registered and affects the output t _{DO} after the clock edge after it is input to the device (see Timing Diagram). Delay lengths are specified in Table 1.
MC	17	20	Mode Control. The Mode Control is used to select the special 4-bit wide split mode. When HIGH, the delay on DO ₇₋₄ is fixed at 18 stages, while DO ₃₋₀ have the delay specified by the length select. When MC is LOW, all eight bits have equal delays as specified by the length select.

Pin Descriptions - TMC2111A

	Pin Number Pin Name DIP PLCC		
Pin Name			Pin Function Description
Power			
V _{DD}	7	8	Supply Voltage. The TMC2111A operates from a single +5V supply. All power and ground lines must be connected.
GND	17,18	20,21,22	Ground. The TMC2111A operates from a single +5V supply. All power and ground lines must be connected.
Data Inputs	5	•	
DI ₇₋₀	12,11,10, 9,4,3,2,1	14,13,12, 10,5,4,3,2	Data Input. Eight inputs are provided for the data, which pass through the shift register unchanged. The TMC2111A consists of a single group of eight bits with all data bits having equal delays.
Data Outpu	its		
DO ₇₋₀	13,14,15, 16,21,22, 23,24	15,16,17, 18,26,27, 28,1	Data Output. The outputs of the shift register are delayed relative to the input signals. The amount of the delay is programmable (see Table 1). The outputs remain valid for a minimum of tho nanoseconds after the leading edge of CLK. This allow the data to be latched into circuits with non-zero hold time requirements.
Controls			
CLK	8	9	Master Clock. All inputs and outputs are synchronous and operate from a single master clock. All operations occur on the rising edge of the master clock.
L3-0	19,20,6,5	23,24,7,6	Length Select. The length select input is used to determine the register delay of the TMC2111A. This input is registered and affects the output tDO after the clock edge after it is input to the device (see Timing Diagram). Delay lengths are specified in Table 1.

Parameter	Min	Тур	Max	Unit
Supply Voltage	-0.5		7.0	V
Input Voltage	-0.5		V _{DD} + 0.5	V
Output, Applied Voltage ²	-0.5		V _{DD} + 0.5	V
Output, Externally Forced Current ^{3,4}	-3.0		6.0	mA
Output, Short Circuit Duration (single output in HIGH state to ground)			1	sec
Operating, Ambient Temperature	-20		110	°C
Junction Temperature			140	°C
Storage Temperature	-65		150	°C
Lead Soldering (10 seconds)			300	°C

Notes:

- 1. Functional operation under any of these conditions is NOT implied. Performance and reliability are guaranteed only if Operating Conditions are not exceeded.
- 2. Applied voltage must be current limited to specified range.
- 3. Forcing voltage must be limited to specified range.
- 4. Current is specified as conventional current flowing into the device.

- Index area: a notch or a pin one identification mark shall be located adjacent to pin one. The manufacturer's identification shall not be used as pin one identification mark.
- 2. The minimum limit for dimension "b2" may be .023 (.58mm) for leads number 1, 12, 13 and 24 only.
- 3. Dimension "Q" shall be measured from the seating plane to the base plane.
- 4. This dimension allows for off-center lid, meniscus and glass overrun.
- The basic pin spacing is .100 (2.54mm) between centerlines. Each pin centerline shall be located within ±.010 (.25mm) of its exact longitudinal position relative to pins 1 and 24.
- 6. Applies to all four corners (leads number 1, 12, 13, and 24).
- "eA" shall be measured at the center of the lead bends or at the centerline of the leads when "a" is 90°.
- 8. All leads Increase maximum limit by .003 (.08mm) measured at the center of the flat, when lead finish applied.
- 9. Twenty-two spaces.

LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

- Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
- A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
