

PS2Adapt™ UR6HCPS2-SP40

Converts PS/2 Data to Serial or SPI

HID & SYSTEM MANAGEMENT PRODUCTS, SYSTEM MANAGEMENT FAMILY

PRELIMINARY

DESCRIPTION

The PS2Adapt™ UR6HCPS2-SP40 is an extremely low-power protocol interpreter that can link an AT / PS/2-compatible Human Input Device (HID), such as a keyboard, mouse, bar-code reader, etc. to any host system equipped with either an asynchronous serial interface or the Serial Peripheral Interface (SPI).

The IC was designed specifically for RISC-based portable devices that are limited to asynchronous and SPI interfaces. The PS2Adapt™ allows designers to easily connect PS/2 devices to their system.

The PS2AdaptTM emulates all the functions of the 8042 keyboard controller which typically resides on the AT / PS/2 motherboard. The extremely low-power PS2AdaptTM will power down even between key presses and bewteen mouse reports. Typical power consumption is only 1 μ A operating between 3-5 Volts.

The extremely low-power boasts 4 external PS/2 ports that support the hot-plug connection of an external PS/2 keyboard or mouse, including MouseWheel, 5-button mice and touch screens in absolute mode.

Each of four external PS/2 ports also support more than 140 key scan codes including international language keys, internet keys, and power keys. The PS2Adapt™ also offers 4 reserved pins for LED functions.

FEATURES

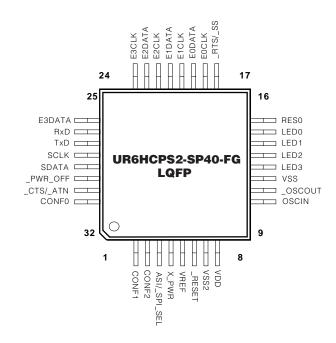

- Typically consumes less than 1 μA
- Interfaces the host system via either an asynchronous serial interface or the Serial Peripheral Interface (SPI)
- Jumper selectable interface and Baud rate
- Offers four PS/2 ports for the hotplug connection of external keyboards or mice including MouseWheel, 5-button mice and absolute mode touch screens
- Easy to use, one way communication protocol
- Operating voltage between 3 and 5 Volts
- Custom versions available in small or large quantities
- Tiny 7x7 mm package to accommodate slim designs

APPLICATIONS

- Hand-held PCs (H/PCs)
- Web phones

- PDAs
- System legacy support

PIN ASSIGNMENTS

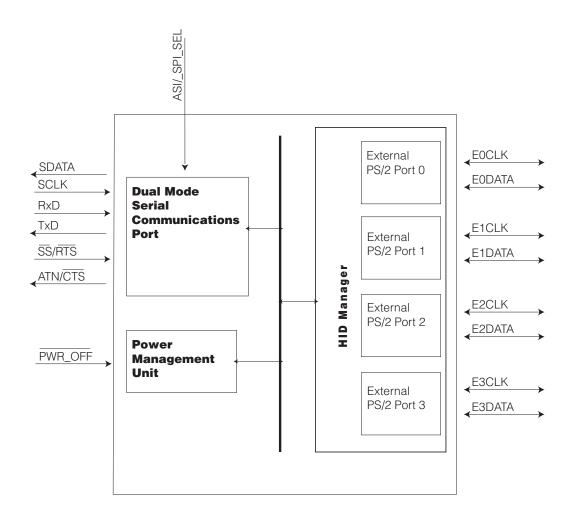

PS2Adapt is a trademark of Semtech Corporation. All other trademarks belong to their respective companies.

FUNCTIONAL DIAGRAM

FUNCTIONAL DESCRIPTION

The PS2Adapt™ consists functionally of three major sections. These are the Dual Mode Serial Communications Interface, the Power Management Unit, and the HID Manager. All sections communicate with each other and operate concurrently.

HID MANAGER

The PS2Adapt™ Human Input Device (HID) Manager is responsible for the configuration and handling of HID devices that are attached to the controller through the four external PS/2 ports. The HID Manager has the following responsibilities:

- 1. Initialize PS/2 keyboards and mice
- 2. Mix the information from external PS/2 devices
- 3. Formatting and relaying reports of the HID devices to the host.

OPERATIONS BELOW 5 V

The standard PS/2 devices are specified for supply voltage of 5V. Operations of the PS2Adapt™ at a lower voltage (3V) are only possible if the HID devices connected to ALL external PS/2 ports are capable of 3V operations.

use

tie to ground

Transmit data (asynchronous serial mode): | Idle = "high" = 1

Receive data (asynchronous serial mode): Reserved for future

Master-In-Slave-Out (SPI mode): keep open for asynchronous mode or

Serial Clock (SPI mode): in SPI mode, use the following Clock sequence: Idle-high/ negative-edge (shift data) \ positive-edge (latch data), idle-high. Keep open or tie to ground for asynchronous mode.

| PIN DEFINITIONS (CO | (D'TNC | | |
|---------------------|--------|------|--------------------------------------|
| Pin Numbers | | | |
| Mnemonic | LQFP | Туре | Name and Function |
| Configuration Pins | | | |
| CONF0 | 32 | 1 | Configuration pin 0; see Note 2 |
| CONF1 | 1 | I | Configuration pin 1; see Note 2 |
| CONF2 | 2 | I | Configuration pin 2; see Note 2 |
| ASI/_SPI_SEL | 3 | | SPI/Serial Selector pin. High:Serial |
| Reserved | | | |
| LED0 | 12 | I/O | Reserved LED driver / GPIO |
| LED1 | 13 | I/O | Reserved LED driver / GPIO |
| LED2 | 14 | I/O | Reserved LED driver / GPIO |
| LED3 | 15 | I/O | Reserved LED driver / GPIO |
| RES0 | 16 | I/O | Reserved GPIO |

Note 1: An underscore in front of the pin mnemonic denotes an active low signal.

Note 2: When asynchronous serial mode is selected, ASI/_SPI_SEL pin is high and pins CONF2:CONF1:CONF0 select the following Baud Rates:

111: 19200 bps; 110: 9600 bps; 101: 1200 bps; 100: 600 bps; 011: 300 bps 010: 31250 bps; 001: 62500 bps.

When SPI mode is selected, ASI/_SPI_SEL pin is low. If CONF0 is high, the transfer sequence is MSB to LSB, otherwise, LSB to MSB.

Note 3: For ASI/_SPI_SEL pin use the following setting:

1: Asynchronous Serial Mode; 0: Serial Peripheral Interface (SPI) mode

Note 4: In asynchronous mode, SDATA and SCLK are driven to low after reset. In SPI mode, TXD, RXD, CONF1 and CONF2 are driven to low after reset. In both asynchronous and SPI mode, LED0, LED1, LED2, LED3 and RES0 are configured as inputs with pull-up resistors.

Pin Types Legend: Al=Analog Input; I=Input; O=Output; I/O=Input or Output; I/nD=Input or Output with N-channel open drain driver;

COMMUNICATIONS INTERFACE FOR THE UR6HCPS2-SP40

The PS2Adapt™ offers two modes of serial communications: Synchronous Peripheral Interface (SPI) mode and asynchronous serial mode.

The PS2Adapt™ determines the mode of communication with the host during power-up by reading the value of the ASI/_SPI_SEL pin. If the pin is tied high, asynchronous mode is enabled. If it is low, the SPI interface is enabled.

The PS2Adapt™ implements the SPI mode by single direction communication that supports bit rates up to 250 Kb/s. Several hosts and companion chips implement the SPI protocol in order to communicate with a wide range of peripherals such as EEPROMs, A/D converters, MCUs and other system components.

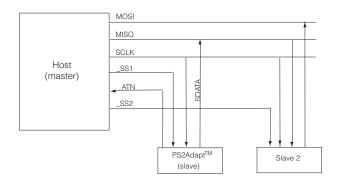

The PS2Adapt™ deploys the _ATN as an additional hand-shake signal in order to support low power operation of the bus.

The PS2Adapt™ implements asynchronous mode at fixed preselected baud rates: 300bps, 600bps, 1200bps, 9600bps, 19200bps, 31250bps and 62500bps, depending on the configuration pins' state on power up.

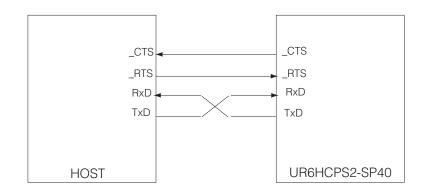

In asynchronous mode, the PS2Adapt™ deploys the _RTS & _CTS as additional hand-shake signals in order to support low power operation of the bus.

The diagrams below illustrate the SPI and asynchronous communications interfaces, respectively.

SPI Communications Interface

Asynchronous Communications Interface

REPORTS

Overview

The PS2Adapt™ reports three types of packet formats for relative mouse, absolute mouse and keyboard report respectively.

Each mouse packet contains 4 bytes; each keyboard packet contains 2 bytes. The 7th bit of each byte is used for synchronization. The 7th bit for the first byte is 1 and for the other bytes is 0.

Keyboard Data Report

Each 8-bit key number (K0-K7) is an identification of a keyboard key, which is defined in the Semtech key table (see Page 7).

PS/2 Mouse Data Report

There are two different kinds of mouse data packages for the external PS/2 devices. One is absolute mode that is for touchscreens and the other is relative mode for standard PS/2 devices, including MouseWheel.

The resolution for the absolute mouse is 10 bits (1000 points) in each direction (X and Y).

The relative mouse data format accommodates data from 5-button and wheel-mouse devices.

Keyboard Packet Format

| Bit Number | | | | | | | | |
|------------|---|-----|--------|---------|--------|--------|---------|------|
| Byte # | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Note 1: In PS/2 mode, Scan Set 1 & 2, each keycode is preceded or followed by additional bytes of data. These codes are documented in WHQLKEYS.DOC, available from Microsoft.

Note 2: These keys have various legends depending upon the locale for which the keyboard is manufactured. Europe 1 is typically in AT-101 Key Position 42 next to the Enter key. Europe 2 is typically in AT-101 Key Position 45, between the Left Shift and Z keys.

ASYNCHRONOUS SERIAL INTERFACE MODE

Baud rate:

The PS2Adapt™ implements asynchronous mode at fixed preselected Baud rates: 300bps, 600bps, 1200bps, 9600bps, 19200bps, 31250bps and 62500bps, depending on the configuration pins' state on power up. The IC can achieve these standard Baud rates by using a 4MHz oscillator.

Protocol:

In asynchronous mode, the PS2Adapt™ supports transmission in one direction only (PS2Adapt™ to host). The PS2Adapt™ starts the transmission to the system when it has mouse/keyboard package pending. The data format is one start bit, 8 data bits, no parity and one stop bit.

- 1. The PS2Adapt™ asserts _CTS low to indicate that a packet transfer will start.
- 2. The host asserts _RTS low to indicate that it is ready to receive data. _RTS low means that system can receive data (e.g. UART is operational).
- 3. The PS2Adapt™ places data on TXD line when it detects the RTS low.
- 4. When one package is successfully transmitted, the IC raises _CTS.

Notes on the Protocol:

To assure fast transmission, the system must assert _RTS low as soon as possible. If the system is ready to receive the data, it doesn't have to raise _RTS between packages.

The PS2Adapt™ checks _RTS after every byte transmission. If _RTS returns to high, it means that the transmission was unsuccessful. The PS2Adapt™ then raises _CTS to abort the transmission and the entire package will be retransmitted.

The maximum time of T1 is 10ms. If the system cannot assert _RTS low after 10ms of _CTS low, the PS2Adapt™ then raises _CTS to abort the transmission request. After that, the PS2Adapt™ tries to start the transmission again.

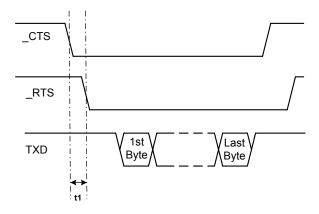

Figure 1: Serial Transmission Timing

SERIAL PERIPHERAL INTERFACE (SPI) MODE

The Serial Peripheral Interface (SPI) is a synchronous bi-directional multi-slave protocol. In SPI mode, the PS2Adapt™ acts as a slave device. The PS2Adapt™ supports only transmission and doesn't support receiving. SPI data transfer can be performed at a maximum clock rate of 500 KHz. If the CONF0 pin is high, the data transfer sequence is MSB to LSB; if CONF0 pin is low the sequence is LSB to MSB. The SDATA pin outputs data every time the transfer clock changes from high to low level.

Protocol:

- 1. The PS2Adapt™ asserts _ATN low to indicate that a mouse packet is waiting for transfer.
- 2. The host asserts _SS low to indicate that it is ready to receive data. _SS low means the system selected SPI PS2Adapt™ as its communication device.
- 3. On detecting _SS low, the IC enables the SPI interface and places data in the SPI data TX buffer. After a short delay, the system supplies eight clocks to get the data from the IC. The minimum time t2 from _SS low to first SPI clock is 50us.
- 4. When a byte is transferred successfully, the system has to wait a minimum of 50µs to begin the clocks for next byte transmission.
- 5. When the four-byte mouse package / 2-byte keyboard package is transmitted, the system stops the SPI clock. If it needs to communicate with other SPI devices, it has to wait for _ATN return to high. _ATN high means the SPI port of PS2Adapt™ is now in high-impedance state.

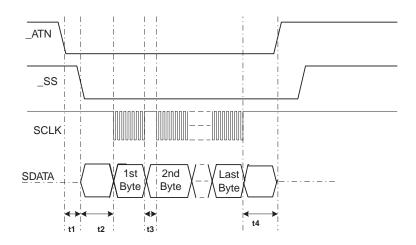

Figure 2: SPI Transmission Timing: (_SS toggles for every package).

Notes on the Protocol:

To assure fast transmission, system must assert _SS low as soon as possible, see Figure 2. If the system is ready to get data, it doesn't have to raise _SS between packages, see Figure 3.

PROTOCOLS FOR THE PS2ADAPT™ IN SPI MODE (CONT'D)

SPI Communication Timing Parameters

| Symbol | Description | Min | Max | Units |
|--------|---|-----|------|-------|
| t1 | _ATN low to _SS low | | 10 | ms |
| t2 | _SS low to first clock (_SS toggles for every package) | 50 | 5000 | μs |
| t2' | _ATN low to first clock (_SS low) | 50 | 5000 | μs |
| t3 | Last clock of transmitted byte to next byte's first clock | 50 | 5000 | μs |
| t4 | Last byte TX finish to _ATN to high | | 30 | μѕ |

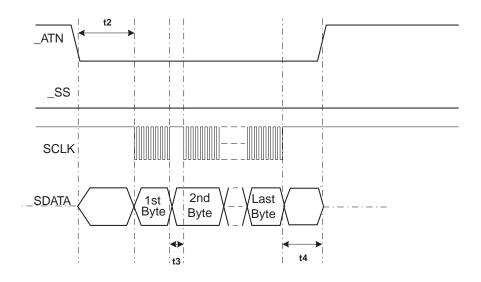

Figure 3: SPI Packet Transmission Timing: (_SS always low).

POWER MANAGEMENT

Modes of Operation

The PS2Adapt[™] has two modes of operation relating to its power consumption.

The "Stop" mode is the lowest power consumption mode. In this mode, the oscillator is stopped and the IC consumes only 1 µA of leakage current. This is the default mode. The PS2Adapt™ reverts to this mode when it is idle.

The "Run" mode is entered briefly, only to process an event or while an interrupt-generating signal condition persists. The PS2Adapt™ remains in this mode until there are no tasks to handle, such as PS/2 reports or inititalization of PS/2 devices.

The PS/2 devices connected to the four external PS/2 ports are initialized at different sampling rates, depending on the port: PS/2 port 0 and PS/2 port 1 to 100 packages per second and 40 packages per second for PS/2 port 3 and PS/2 port 4. When mice plugged into PS/2 port 0 and 1 are moved, the PS2Adapt™ will typically stay in stop mode for 25% of the working time. When mice plugged into PS/2 port 3 and 4 are moved with a slower sampling rate, the PS2Adapt™ will typically stay in stop mode for 72% of working time. Therefore, we recommend that PS/2 port 3 and 4 are used for mice, if there is no specific requirement of mice sampling rate.

Note 1: When there is no mouse motion, all ports have same power consumption, less than 1 μ A.

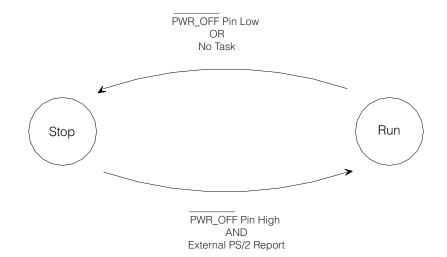

Note 2: When a keyboard is plugged into these ports, the power consumption is the same, less than 1 μ A.

The PS2Adapt™ implements two power management methods: system-coordinated power management and Self-Power Management™ (SPM).

System-coordinated power management is implemented by the _PWR_OFF pin (Power Off). If the _PWR_OFF pin is low, the PS2Adapt™ disables all external PS/2 device reports to save power and to turn off keyboard LEDs.

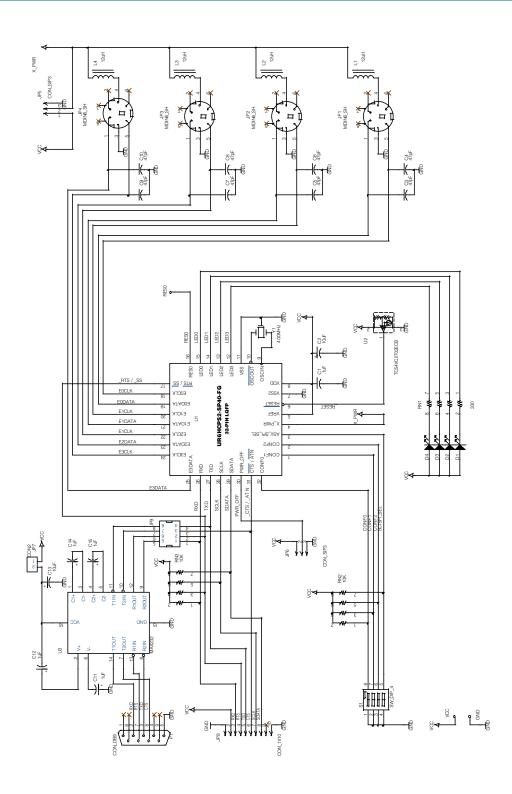

Self-Power ManagementTM is a method implemented by the PS2AdaptTM that, independently of any system intervention, results in the lowest power consumption possible within the given parameters of its operation. Through Self-Power ManagementTM, the PS2AdaptTM is capable of typically operating at only 1 μ A, independent of the state of the system. Self-Power ManagementTM primarily determines the actual power consumption of the PS2AdaptTM.

Even when the host is in the active state, the IC can still operate most of the time at only 1 µA, even with active external PS/2 devices attached to it.
