

## N- and P-Channel Quad Power MOSFET Arrays

### Ordering Information

BV <sub>DSS</sub> / BV <sub>DGS</sub>	R <sub>DS (ON)</sub> (max) Q1 + Q2 or Q3 + Q4	V <sub>GS (th)</sub> (max)		Order Number / Package
		N-Channel	P-Channel	
40V	3.0Ω	2.0V	-3.0V	VQ3001N6
20V	3.0Ω	2.0V	-3.0V	VQ7254N6

### Features

- Free from secondary breakdown
- Low power drive requirement
- Ease of paralleling
- Low C<sub>ISS</sub> and fast switching speeds
- Excellent thermal stability
- Integral Source-Drain diode
- High input impedance and high gain
- Complementary N- and P-channel devices
- Low threshold version available

### Advanced DMOS Technology

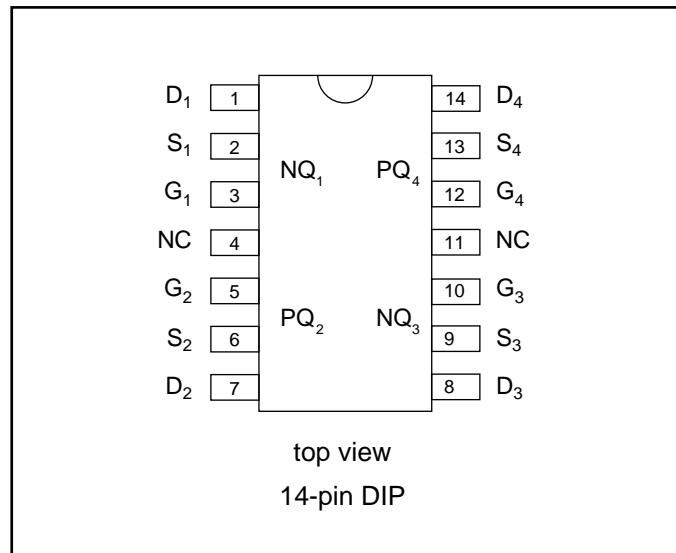

These enhancement-mode (normally-off) DMOS FET arrays utilize a vertical DMOS structure and Supertex's well-proven silicon-gate manufacturing process. This combination produces devices with the power handling capabilities of bipolar transistors and with the high input impedance and positive temperature coefficient inherent in MOS devices. Characteristic of all MOS structures, these devices are free from thermal runaway and thermally-induced secondary breakdown.

Supertex quad arrays use four independent DMOS transistors. They are ideally suited to a wide range of switching and amplifying applications where high breakdown voltage, high input impedance, low input capacitance, and fast switching speeds are desired.

### Applications

- Telecom switches
- Logic level interfaces
- Battery operated systems
- Photo voltaic drives
- Solid state relays
- Motor controls

### Notes:

- All D.C. parameters 100% tested (pulse test: 300μs pulse, 2% duty cycle).
- All A.C. parameters sample tested.
- Refer to device types TN06L and TP06L for characteristic curves.

## Switching Waveforms and Test Circuit
