

Single Supply / Low Power / 1024-tap / 2-Wire bus

## Preliminary Information

## X9119

## Single Digitally-Controlled (XDCP™) Potentiometer

## FEATURES

- 1024 Resistor Taps – 10-Bit Resolution
- 2-Wire Serial Interface for write, read, and transfer operations of the potentiometer
- Wiper Resistance, 40Ω Typical @  $V_{CC} = 5V$
- Four Non-Volatile Data Registers
- Non-Volatile Storage of Multiple Wiper Positions
- Power On Recall. Loads Saved Wiper Position on Power Up.
- Standby Current < 3μA Max
- $V_{CC}$ : 2.7V to 5.5V Operation
- 100KΩ End to End Resistance
- 100 yr. Data Retention
- Endurance: 100,000 Data Changes Per Bit Per Register
- 14-Lead TSSOP, 15-Lead CSP (Chip Scale Package)
- Low Power CMOS
- Single Supply version of the X9118

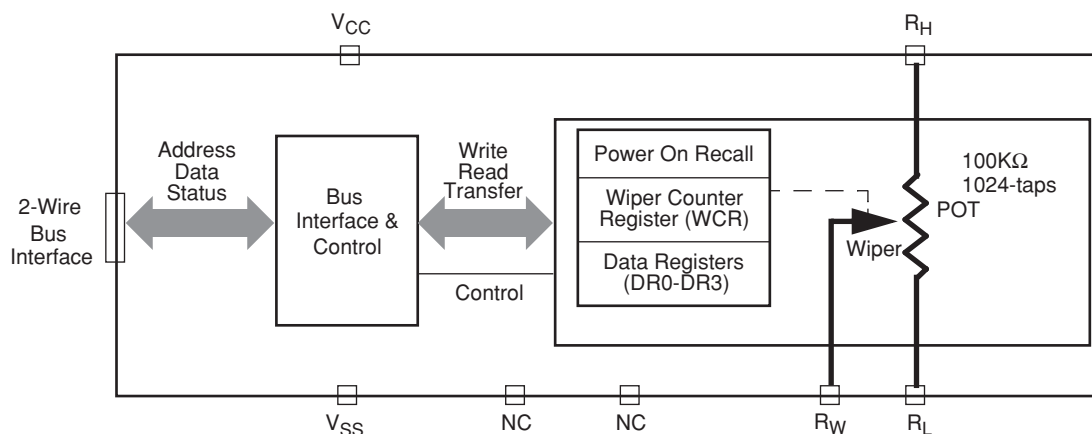

## DESCRIPTION

The X9119 integrates a single digitally controlled potentiometer (XDCP) on a monolithic CMOS integrated circuit.

The digital controlled potentiometer is implemented using 1023 resistive elements in a series array. Between each element are tap points connected to the wiper terminal through switches. The position of the wiper on the array is controlled by the user through the 2-wire bus interface. The potentiometer has associated with it a volatile Wiper Counter Register (WCR) and a four non-volatile Data Registers that can be directly written to and read by the user. The contents of the WCR controls the position of the wiper on the resistor array through the switches. Powerup recalls the contents of the default data register (DR0) to the WCR.

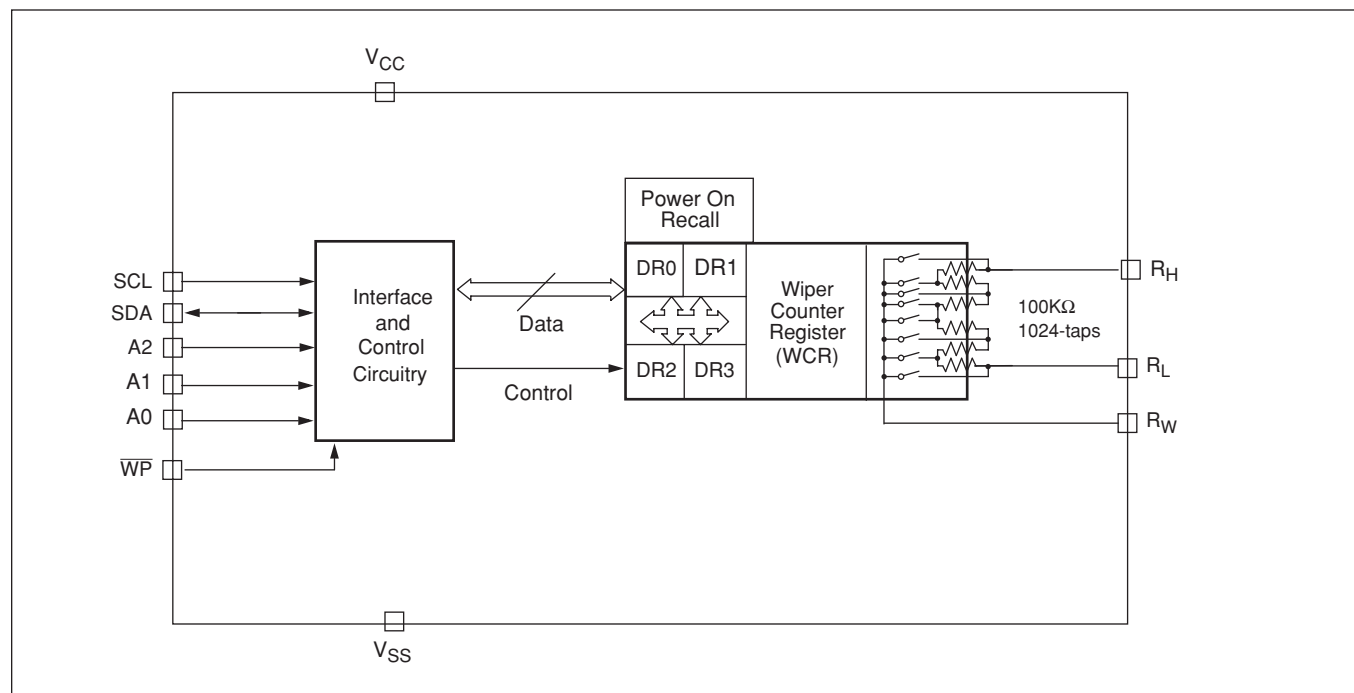

The XDCP can be used as a three-terminal potentiometer or as a two terminal variable resistor in a wide variety of applications including control, parameter adjustments, and signal processing.

## FUNCTIONAL DIAGRAM

# X9119 – Preliminary Information

## DETAILED FUNCTIONAL DIAGRAM

## CIRCUIT LEVEL APPLICATIONS

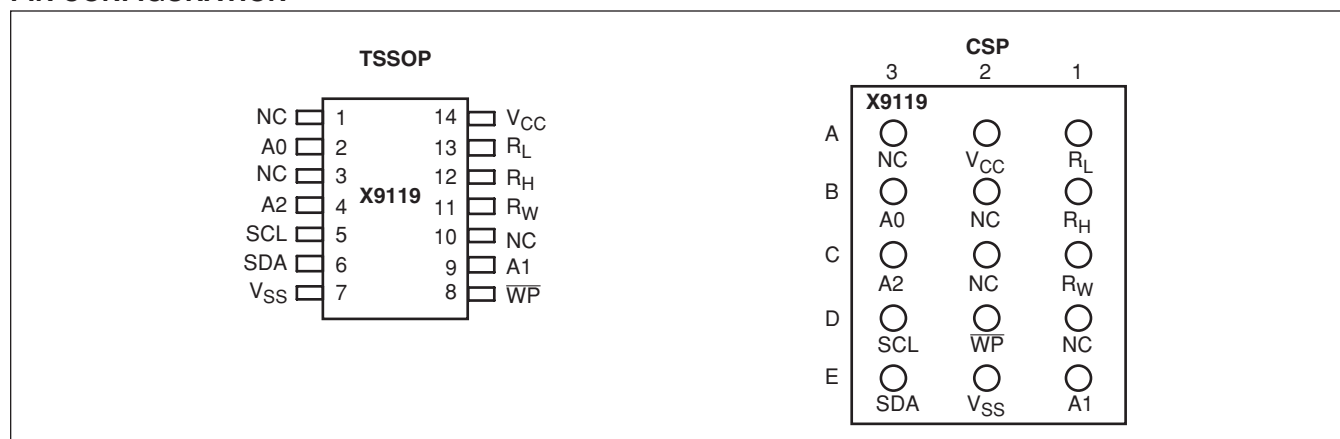

- Vary the gain of a voltage amplifier
- Provide programmable dc reference voltages for comparators and detectors
- Control the volume in audio circuits
- Trim out the offset voltage error in a voltage amplifier circuit
- Set the output voltage of a voltage regulator
- Trim the resistance in Wheatstone bridge circuits
- Control the gain, characteristic frequency and Q-factor in filter circuits
- Set the scale factor and zero point in sensor signal conditioning circuits
- Vary the frequency and duty cycle of timer ICs
- Vary the dc biasing of a pin diode attenuator in RF circuits
- Provide a control variable (I, V, or R) in feedback circuits

## SYSTEM LEVEL APPLICATIONS

- Adjust the contrast in LCD displays
- Control the power level of LED transmitters in communication systems
- Set and regulate the DC biasing point in an RF power amplifier in wireless systems
- Control the gain in audio and home entertainment systems
- Provide the variable DC bias for tuners in RF wireless systems
- Set the operating points in temperature control systems
- Control the operating point for sensors in industrial systems
- Trim offset and gain errors in artificial intelligent systems

## PIN DESCRIPTIONS

### Bus Interface Pins

#### SERIAL DATA INPUT/OUTPUT (SDA)

The SDA is a bidirectional serial data input/output pin for a 2-wire slave device and is used to transfer data into and out of the device. It receives device address, opcode, wiper register address and data sent from an 2-wire master at the rising edge of the serial clock SCL, and it shifts out data after each falling edge of the serial clock SCL.

It is an open drain output and may be wire-ORed with any number of open drain or open collector outputs. An open drain output requires the use of a pull-up resistor. For selecting typical values, refer to the guidelines for calculating typical values on the bus pull-up resistors graph.

#### SERIAL CLOCK (SCL)

This input is used by 2-wire master to supply 2-wire serial clock to the X9119.

#### DEVICE ADDRESS ( $A_2$ – $A_0$ )

The Address inputs are used to set the least significant 3 bits of the 8-bit slave address. A match in the slave address serial data stream must be made with the Address input in order to initiate communication with the X9119. A maximum of 8 devices may occupy the 2-wire serial bus.

#### Hardware Write Protect Input ( $\overline{WP}$ )

The  $\overline{WP}$  pin when LOW prevents nonvolatile writes to the Data Registers.

### Potentiometer Pins

#### $R_H$ , $R_L$

The  $R_H$  and  $R_L$  pins are equivalent to the terminal connections on a mechanical potentiometer.

#### $R_W$

The wiper pin are equivalent to the wiper terminal of a mechanical potentiometer.

### Bias Supply Pins

#### SYSTEM SUPPLY VOLTAGE ( $V_{CC}$ ) AND SUPPLY GROUND ( $V_{SS}$ )

The  $V_{CC}$  pin is the system supply voltage. The  $V_{SS}$  pin is the system ground.

### Other Pins

#### No CONNECT

No connect pins should be left open. These pins are used for Xicor manufacturing and testing purposes.

## PRINCIPLES OF OPERATION

The X9119 is an integrated microcircuit incorporating a resistor array and its associated registers and counters and the serial interface logic providing direct communication between the host and the digitally controlled potentiometer. This section provides detail description of the following:

- Resistor Array Description
- Serial Interface Description
- Instruction and Register Description

### Resistor Array Description

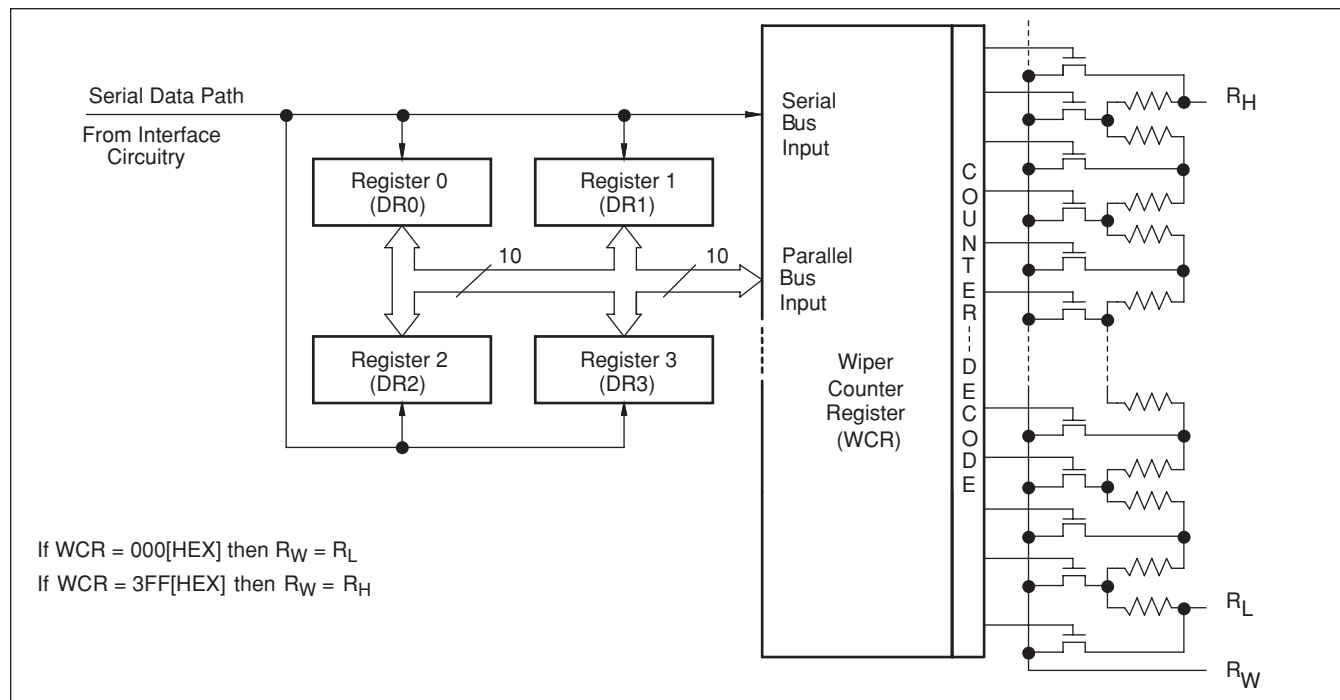

The X9119 is comprised of a resistor array. The array contains, in effect, 1023 discrete resistive segments that are connected in series (see Figure 1). The physical ends of each array are equivalent to the fixed terminals of a mechanical potentiometer ( $R_H$  and  $R_L$  inputs).

At both ends of each array and between each resistor segment is a CMOS switch connected to the wiper ( $R_W$ ) output. Within each individual array only one switch may be turned on at a time. These switches are controlled by the Wiper Counter Register (WCR). The 10-bits of the WCR (WCR[9:0]) are decoded to select, and enable, one of 1024 switches.

The WCR may be written directly. The Data Registers and the WCR can be read and written by the host system.

# X9119 – Preliminary Information

Figure 1. Detailed Potentiometer Block Diagram

## Serial Interface Description

### SERIAL INTERFACE

The X9119 supports a bidirectional bus oriented protocol. The protocol defines any device that sends data onto the bus as a transmitter and the receiving device as the receiver. The device controlling the transfer is a master and the device being controlled is the slave. The master will always initiate data transfers and provide the clock for both transmit and receive operations. Therefore, the X9119 will be considered a slave device in all applications.

### CLOCK AND DATA CONVENTIONS

Data states on the SDA line can change only during SCL LOW periods. SDA state changes during SCL HIGH are reserved for indicating start and stop conditions. See Figure 3.

### START CONDITION

All commands to the X9119 are preceded by the start condition, which is a HIGH to LOW transition of SDA while SCL is HIGH. The X9119 continuously monitors the SDA and SCL lines for the start condition and will not respond to any command until this condition is met. See Figure 3.

### STOP CONDITION

All communications must be terminated by a stop condition, which is a LOW to HIGH transition of SDA while SCL is HIGH. See Figure 3.

### ACKNOWLEDGE

Acknowledge is a software convention used to provide a positive handshake between the master and slave devices on the bus to indicate the successful receipt of data. The transmitting device, either the master or the slave, will release the SDA bus after transmitting eight bits. The master generates a ninth clock cycle and during this period the receiver pulls the SDA line LOW to acknowledge that it successfully received the eight bits of data.

The X9119 will respond with an acknowledge after recognition of a start condition and its slave address and once again after successful receipt of the command byte. If the command is followed by a data byte the X9119 will respond with a final acknowledge. See Figure 2.

## X9119 – Preliminary Information

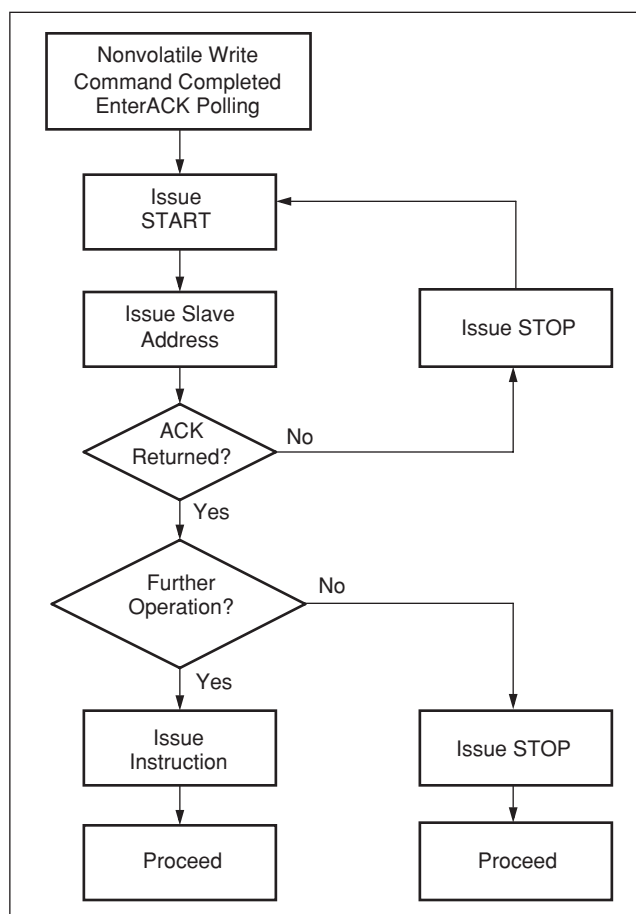

**Figure 2. Acknowledge Response from Receiver**

### ACKNOWLEDGE POLLING

The disabling of the inputs, during the internal nonvolatile write operation, can be used to take advantage of the typical 5ms EEPROM write cycle time. Once the stop condition is issued to indicate the end of the nonvolatile write command the X9119 initiates the internal write cycle. ACK polling, Flow 1, can be initiated immediately. This involves issuing the start condition followed by the device slave address. If the X9119 is still busy with the write operation no ACK will be returned. If the X9119 has completed the write operation an ACK will be returned and the master can then proceed with the next operation.

### FLOW 1. ACK Polling Sequence

# X9119 – Preliminary Information

## Instruction and Register Description

### DEVICE ADDRESSING: IDENTIFICATION BYTE (ID AND A)

Following a start condition the master must output the address of the slave it is accessing. The most significant four bits of the slave address are the device type identifier. The ID[3:0] bits is the device id for the X9119; this is fixed as 0101[B] (refer to Table 1).

The A2–A0 bits in the ID byte is the internal slave address. The physical device address is defined by the state of the A2–A0 input pins. The slave address is externally specified by the user. The X9119 compares the serial data stream with the address input state; a successful compare of both address bits is required for the X9119 to successfully continue the command sequence. Only the device which slave address

matches the incoming device address sent by the master executes the instruction. The A2–A0 inputs can be actively driven by CMOS input signals or tied to  $V_{CC}$  or  $V_{SS}$ . The  $R/\overline{W}$  bit is the LSB and is be used to program the device for read or write operations.

### INSTRUCTION BYTE AND REGISTER SELECTION

The next byte sent to the X9119 contains the instruction and register pointer information. The three most significant bits are used provide the instruction opcode (IOP[2:0]). The RB and RA bits point to one of the four registers. The format is shown below in Table 2.

Table 3 provides a complete summary of the instruction set opcodes.

Table 1. Identification Byte Format

Table 2. Instruction Byte Format

Register Selected	RB	RA
DR0	0	0
DR1	0	1
DR2	1	0
DR3	1	1

## X9119 – Preliminary Information

**Table 3. Instruction Set**

Instruction	R/W	Instruction Set								Operation
		I <sub>2</sub>	I <sub>1</sub>	I <sub>0</sub>	0	RB	RA	0	0	
Read Wiper Counter Register	1	1	0	0	0	0	0	0	0	Read the contents of the Wiper Counter Register
Write Wiper Counter Register	0	1	0	1	0	0	0	0	0	Write new value to the Wiper Counter Register
Read Data Register	1	1	0	1	0	1/0	1/0	0	0	Read the contents of the Data Register pointed to RB-RA.
Write Data Register	0	1	1	0	0	1/0	1/0	0	0	Write new value to the Data Register pointed to RB-RA.
XFR Data Register to Wiper Counter Register	1	1	1	0	0	1/0	1/0	0	0	Transfer the contents of the Data Register pointed to by RB-RA.to the Wiper Counter Register
XFR Wiper Counter Register to Data Register	0	1	1	1	0	1/0	1/0	0	0	Transfer the contents of the Wiper Counter Register to the Data Register pointed to by RB-RA.

**Note:** (1) 1/0 = data is one or zero.

### Instruction and Register Description

#### DEVICE ADDRESSING

#### WIPER COUNTER REGISTER (WCR)

The X9119 contains a Wiper Counter Registers (see Table 4) for the XDCP potentiometer. The WCR is equivalent to a serial-in, parallel-out register/counter with its outputs decoded to select one of 1024 switches along its resistor array. The contents of the WCR can be altered in one of three ways: (1) it may be written directly by the host via the write wiper counter register instruction (serial load); (2) it may be written indirectly by transferring the contents of one of four associated data registers via the XFR data register; (3) it is loaded with the contents of its data register zero (R0) upon power-up.

The Wiper Counter Register is a volatile register; that is, its contents are lost when the X9119 is powered-down. Although the register is automatically loaded

with the value in DR0 upon power-up, this may be different from the value present at power-down. Power-up guidelines are recommended to ensure proper loadings of the DR0 value into the WCR.

#### DATA REGISTERS (DR0 TO DR3)

The potentiometer has four 10-bit non-volatile Data Registers. These can be read or written directly by the host. Data can also be transferred between any of the four Data Registers and the Wiper Counter Register. All operations changing data in one of the data registers is a nonvolatile operation and will take a maximum of 10ms.

If the application does not require storage of multiple settings for the potentiometer, the Data Registers can be used as regular memory locations for system parameters or user preference data.

Bit 9–Bit 0 are used to store one of the 1024 wiper position (0 ~1023).

## X9119 – Preliminary Information

**Table 4. Wiper Control Register, WCR (10-bit), WCR9–WCR0:** Used to store the current wiper position (Volatile, V)

WCR9	WCR8	WCR7	WCR6	WCR5	WCR4	WCR3	WCR2	WCR1	WCR0
V	V	V	V	V	V	V	V	V	V
(MSB)									(LSB)

**Table 5. Data Register, DR (10-bit), Bit 9–Bit 0:** Used to store wiper positions or data (Non-Volatile, NV)

Bit 9	Bit 8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
NV	NV	NV	NV	NV	NV	NV	NV	NV	NV
MSB									LSB

Four of the six instructions are four bytes in length. These instructions are:

- **Read Wiper Counter Register** – read the current wiper position of the selected potentiometer,
- **Write Wiper Counter Register** – change current wiper position of the selected potentiometer,
- **Read Data Register** – read the contents of the selected Data Register;
- **Write Data Register** – write a new value to the selected Data Register.

The basic sequence of the four byte instructions is illustrated in Figure 3. These four-byte instructions exchange data between the WCR and one of the Data Registers. A transfer from a data register to a WCR is essentially a write to a static RAM, with the static RAM controlling the wiper position. The response of the wiper to this action will be delayed by  $t_{WRL}$ . A transfer from the WCR (current wiper position), to a data register is a write to nonvolatile memory and takes a minimum of  $t_{WR}$  to complete. The transfer can occur between one of the four potentiometers and one of its associated registers.

Two instructions (see Figure 4) require a two-byte sequence to complete. These instructions transfer data between the host and the X9119; either between the host and one of the data registers or directly between the host and the Wiper Counter Register. These instructions are:

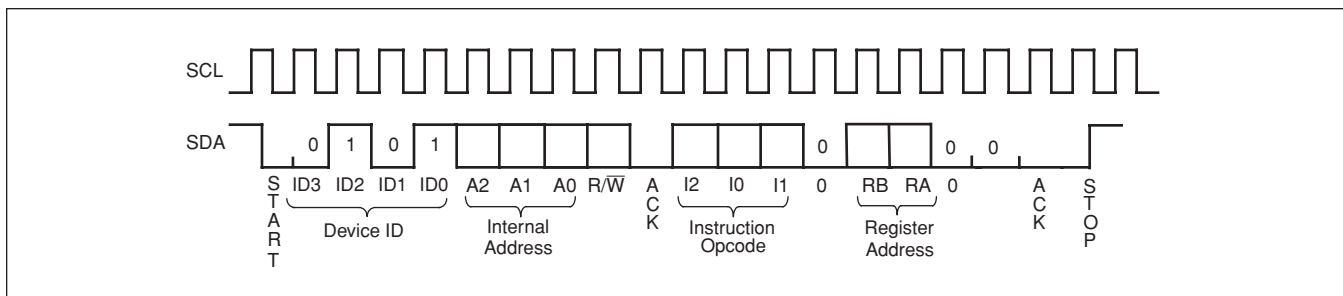

- **XFR Data Register to Wiper Counter Register** – This transfers the contents of one specified Data Register to the Wiper Counter Register.
- **XFR Wiper Counter Register to Data Register** – This transfers the contents of the Wiper Counter Register to the specified Data Register.

See Instruction format for more details.

### POWER UP AND DOWN REQUIREMENTS

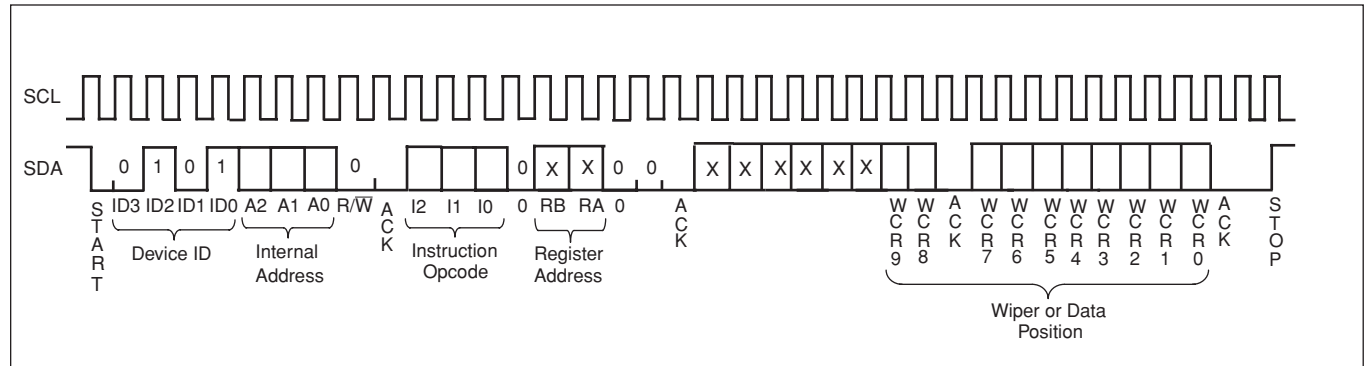

There are no restrictions on the power-up condition of  $V_{CC}$  and the voltages applied to the potentiometer pins provided that the  $V_{CC}$  is always more positive than or equal to the voltages at  $R_H$ ,  $R_L$ , and  $R_W$ , i.e.  $V_{CC} \geq R_H$ ,  $R_L$ ,  $R_W$ . There are no restrictions on the power-down condition. However, the datasheet parameters for the DCP do not apply until 1millisecond after  $V_{CC}$  reaches its final value.

**Notes:** (1) "A2 ~ A0": stand for the device addresses sent by the master.  
(2) WCRx refers to wiper position data in the Wiper Counter Register

## X9119 – Preliminary Information

### ABSOLUTE MAXIMUM RATINGS

Temperature under bias..... –65°C to +135°C  
 Storage temperature..... –65°C to +150°C  
 Voltage on SCL, SDA, or any address input  
   with respect to  $V_{SS}$  ..... –1V to +7V  
 $\Delta V = | (V_H - V_L) |$  ..... 5V  
 Lead temperature (soldering, 10 seconds) ..... 300°C  
 $I_W$  (10 seconds) .....  $\pm 6$ mA

### COMMENT

Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only; the functional operation of the device (at these or any other conditions above those listed in the operational sections of this specification) is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### RECOMMENDED OPERATING CONDITIONS

Temp	Min.	Max.
Commercial	0°C	+70°C
Industrial	–40°C	+85°C

Device	Supply Voltage ( $V_{CC}$ ) Limits <sup>(4)</sup>
X9119	5V $\pm 10\%$
X9119-2.7	2.7V to 5.5V

### ANALOG CHARACTERISTICS (Over recommended industrial (2.7V) operation conditions unless otherwise stated.)

Symbol	Parameter	Limits				Test Conditions
		Min.	Typ.	Max.	Units	
$R_{TOTAL}$	End to End Resistance		100		k $\Omega$	
	End to End Resistance Tolerance			$\pm 20$	%	
	Power Rating			50	mW	25°C, each pot
$I_W$	Wiper Current			$\pm 3$	mA	
$R_W$	Wiper Resistance		40	110	$\Omega$	Wiper Current = $\pm 50\mu A$ , $V_{CC} = 5V$
			150	300	$\Omega$	Wiper Current = $\pm 50\mu A$ , $V_{CC} = 3V$
$V_{TERM}$	Voltage on any $R_H$ or $R_L$ Pin	$V_{SS}$		5	V	$V_{SS} = 0V$
	Noise		-120		dBV	Ref: 1V
	Resolution		0.1		%	
	Absolute Linearity <sup>(1)</sup>			$\pm 1$	MI <sup>(3)</sup>	$R_{W(n)(actual)} - R_{W(n)(expected)}$ , where n=8 to 1006
			$\pm 1.5$	$\pm 2.0$	MI <sup>(3)</sup>	$R_{W(n)(actual)} - R_{W(n)(expected)}$ <sup>(5)</sup>
	Relative Linearity <sup>(2)</sup>			$\pm 0.5$	MI <sup>(3)</sup>	$R_{W(m+1)} - [R_{W(m)} + MI]$ , where m=8 to 1006
			$\pm 0.5$	$\pm 1.0$	MI <sup>(3)</sup>	$R_{W(m+1)} - [R_{W(m)} + MI]$ <sup>(5)</sup>
	Temperature Coefficient of $R_{TOTAL}$		$\pm 300$		ppm/°C	
	Ratiometric Temp. Coefficient			20	ppm/°C	
$C_H/C_L/C_W$	Potentiometer Capacitances		10/10/25		pF	See Macro model

**Notes:** (1) Absolute linearity is utilized to determine actual wiper voltage versus expected voltage as determined by wiper position when used as a potentiometer.

(2) Relative linearity is utilized to determine the actual change in voltage between two successive tap positions when used as a potentiometer. It is a measure of the error in step size.

(3)  $MI = RTOT / 1023$  or  $(R_H - R_L) / 1023$ , single pot

(4) n = 0, 1, 2, ..., 1023; m = 0, 1, 2, ..., 1022.

(5) ESD Rating on  $R_H$ ,  $R_L$ ,  $R_W$  pins is 1.5KV (HBM, 1.0 $\mu A$  leakage maximum), ESD rating on all other pins is 2.0KV.

## X9119 – Preliminary Information

### D.C. OPERATING CHARACTERISTICS (Over the recommended operating conditions unless otherwise specified.)

Symbol	Parameter	Limits				Test Conditions
		Min.	Typ.	Max.	Units	
$I_{CC1}$	$V_{CC}$ supply current (active)			3	mA	$f_{SCL} = 400\text{KHz}$ ; $V_{CC} = +5.5\text{V}$ ; SDA = Open; (for 2-wire, Active, Read and Volatile Write States only)
$I_{CC2}$	$V_{CC}$ supply current (nonvolatile write)			5	mA	$f_{SCL} = 400\text{KHz}$ ; $V_{CC} = +5.5\text{V}$ ; SDA = Open; (for 2-wire, Active, Non-volatile Write State only)
$I_{SB}$	$V_{CC}$ current (standby)			3	$\mu\text{A}$	$V_{CC} = +5.5\text{V}$ ; $V_{IN} = V_{SS}$ or $V_{CC}$ ; SDA = $V_{CC}$ ; (for 2-wire, Standby State only)
$I_{LI}$	Input leakage current			10	$\mu\text{A}$	$V_{IN} = V_{SS}$ to $V_{CC}$
$I_{LO}$	Output leakage current			10	$\mu\text{A}$	$V_{OUT} = V_{SS}$ to $V_{CC}$
$V_{IH}$	Input HIGH voltage	$V_{CC} \times 0.7$		$V_{CC} + 1$	V	
$V_{IL}$	Input LOW voltage	-1		$V_{CC} \times 0.3$	V	
$V_{OL}$	Output LOW voltage			0.4	V	$I_{OL} = 3\text{mA}$
$V_{OH}$	Output HIGH voltage					

### ENDURANCE AND DATA RETENTION

Parameter	Min.	Units
Minimum Endurance	100,000	Data changes per bit per register
Data Retention	100	years

### CAPACITANCE

Symbol	Test	Max.	Units	Test Conditions
$C_{IN/OUT}^{(6)}$	Input/Output capacitance (SI)	8	pF	$V_{OUT} = 0\text{V}$
$C_{IN}^{(6)}$	Input capacitance (SCL, $\overline{WP}$ , A1 and A0)	6	pF	$V_{IN} = 0\text{V}$

### POWER-UP TIMING

Symbol	Parameter	Min.	Max.	Units
$t_r V_{CC}^{(6)}$	$V_{CC}$ Power-up Rate	0.2	50	V/ms
$t_{PUR}^{(7)}$	Power-up to Initiation of read operation		1	ms
$t_{PUW}^{(7)}$	Power-up to Initiation of write operation		50	ms

**Notes:** (6) This parameter is not 100% tested.

(7)  $t_{PUR}$  and  $t_{PUW}$  are the delays required from the time the (last) power supply ( $V_{CC}$ ) is stable until the specific instruction can be issued. These parameters are not 100% tested.

(8) This is not a tested or guaranteed parameter and should be used only as a guideline.

	N/A	Center Line is High Impedance

## X9119 – Preliminary Information

### TIMING DIAGRAMS

#### Start and Stop Timing

#### Input Timing

#### Output Timing

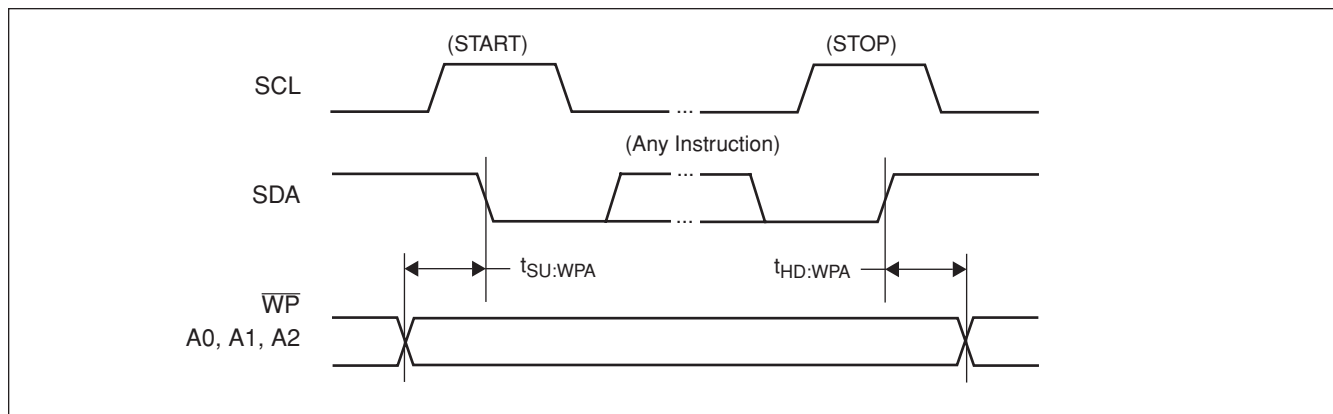

## X9119 – Preliminary Information

### XDCP Timing (for All Load Instructions)

### Write Protect and Device Address Pins Timing

# X9119 – Preliminary Information

## APPLICATIONS INFORMATION

### Basic Configurations of Electronic Potentiometers

Three terminal Potentiometer;  
Variable voltage divider

Two terminal Variable Resistor;  
Variable current

### Application Circuits

#### Noninverting Amplifier

$$V_O = (1 + R_2/R_1)V_S$$

#### Voltage Regulator

$$V_O (\text{REG}) = 1.25V (1 + R_2/R_1) + I_{\text{adj}} R_2$$

#### Offset Voltage Adjustment

#### Comparator with Hysteresis

$$V_{UL} = \{R_1/(R_1 + R_2)\} V_O(\text{max})$$

$$V_{RL} = \{R_1/(R_1 + R_2)\} V_O(\text{min})$$

# X9119 – Preliminary Information

## Application Circuits (Continued)

**Attenuator**

$$V_O = G V_S$$

$$-1/2 \leq G \leq +1/2$$

**Filter**

$$G_O = 1 + R_2/R_1$$

$$f_c = 1/(2\pi RC)$$

**Inverting Amplifier**

$$V_O = G V_S$$

$$G = -R_2/R_1$$

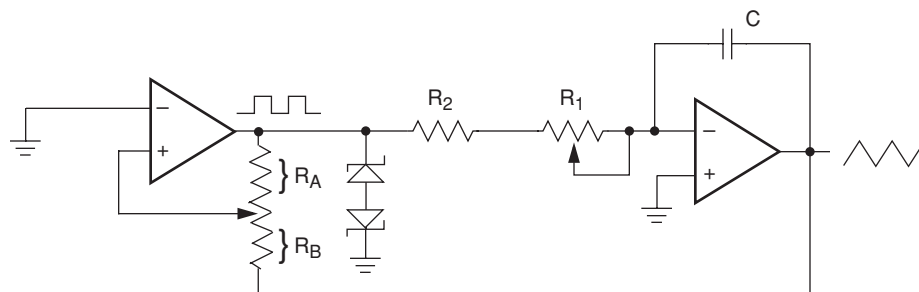

**Equivalent L-R Circuit**

$$Z_{IN} = R_2 + s R_2 (R_1 + R_3) C_1 = R_2 + s L_{eq}$$

$$(R_1 + R_3) \gg R_2$$

**Function Generator**

$$\text{frequency} \propto R_1, R_2, C$$

$$\text{amplitude} \propto R_A, R_B$$

### 15-Bump Chip Scale Package (CSP B15) Package Outline Drawing

#### Package Dimensions

	Symbol	Millimeters		
		Min	Nominal	Max
Package Width	a	2.535	2.565	2.595
Package Length	b	3.272	3.302	3.332
Package Height	c	0.644	0.677	0.710
Body Thickness	d	0.444	0.457	0.470
Ball Height	e	0.200	0.220	0.240
Ball Diameter	f	0.300	0.320	0.340
Ball Pitch - Width	j		0.5	
Ball Pitch - Length	k		0.5	
Ball to Edge Spacing – Width	l	0.758	0.783	0.808
Ball to Edge Spacing - Length	m	0.626	0.651	0.676

#### Ball Matrix

	3	2	1
<b>A</b>	NC*	Vcc	R <sub>L</sub>
<b>B</b>	A0	NC**	R <sub>H</sub>
<b>C</b>	A2	NC**	R <sub>W</sub>
<b>D</b>	SCL	WP	NC*
<b>E</b>	SDA	Vss	A1

\* no-connect by specification only; bump is connected to bond pad

\*\* True no-connect bump

### LIMITED WARRANTY

©Xicor, Inc. 2003 Patents Pending

Devices sold by Xicor, Inc. are covered by the warranty and patent indemnification provisions appearing in its Terms of Sale only. Xicor, Inc. makes no warranty, express, statutory, implied, or by description regarding the information set forth herein or regarding the freedom of the described devices from patent infringement. Xicor, Inc. makes no warranty of merchantability or fitness for any purpose. Xicor, Inc. reserves the right to discontinue production and change specifications and prices at any time and without notice.

Xicor, Inc. assumes no responsibility for the use of any circuitry other than circuitry embodied in a Xicor, Inc. product. No other circuits, patents, or licenses are implied.

### TRADEMARK DISCLAIMER:

Xicor and the Xicor logo are registered trademarks of Xicor, Inc. AutoStore, Direct Write, Block Lock, SerialFlash, MPS, and XDCP are also trademarks of Xicor, Inc. All others belong to their respective owners.

### U.S. PATENTS

Xicor products are covered by one or more of the following U.S. Patents: 4,326,134; 4,393,481; 4,404,475; 4,450,402; 4,486,769; 4,488,060; 4,520,461; 4,533,846; 4,599,706; 4,617,652; 4,668,932; 4,752,912; 4,829,482; 4,874,967; 4,883,976; 4,980,859; 5,012,132; 5,003,197; 5,023,694; 5,084,667; 5,153,880; 5,153,691; 5,161,137; 5,219,774; 5,270,927; 5,324,676; 5,434,396; 5,544,103; 5,587,573; 5,835,409; 5,977,585. Foreign patents and additional patents pending.

### LIFE RELATED POLICY

In situations where semiconductor component failure may endanger life, system designers using this product should design the system with appropriate error detection and correction, redundancy and back-up features to prevent such an occurrence.

Xicor's products are not authorized for use in critical components in life support devices or systems.

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
