XICOR CONFIDENTIAL

Digitally Controlled Potentiometer (XDCP™)   X93156
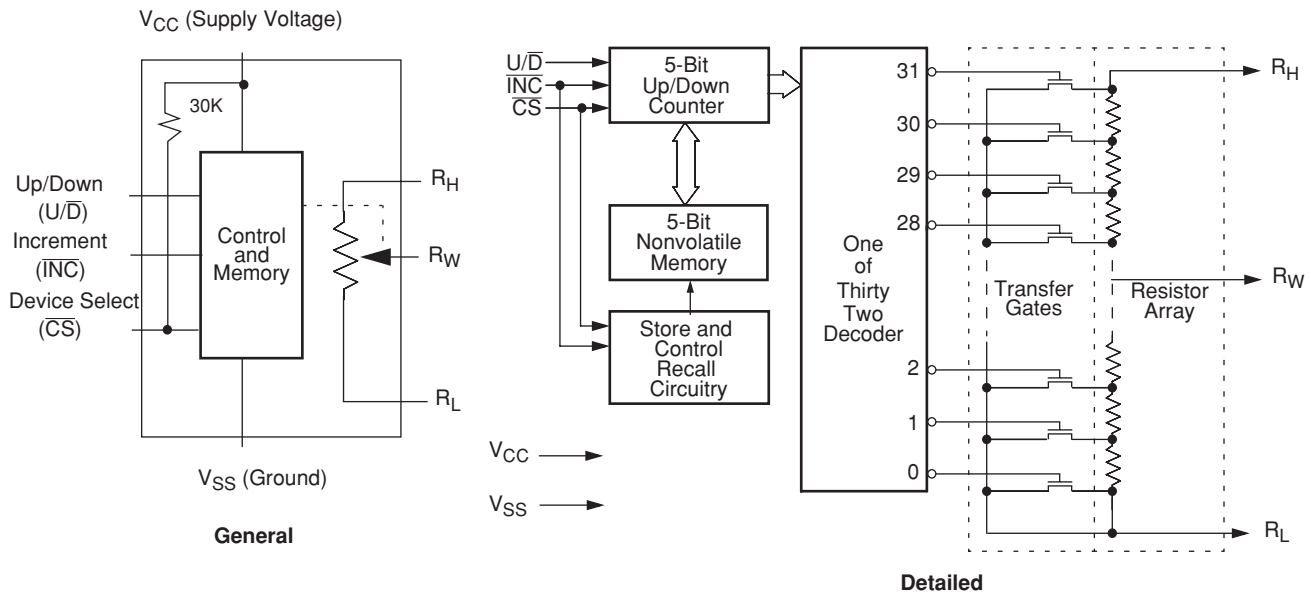

FEATURES

- **Solid-state potentiometer**
- **Up/Down interface**
- **32 wiper tap points**
  - **—Wiper position stored in nonvolatile memory and recalled on power-up**
- **31 resistive elements**
  - **—Temperature compensated**
  - **—Maximum resistance tolerance of ± 25%**
  - **—Terminal voltage, 0 to V_{CC}**
- **Low power CMOS**
  - **—V_{CC} = 2.7 V – 5.5 V**
  - **—Active current, 200µA typ.**
  - **—Standby current, 2µA max.**
- **High reliability**
  - **—Endurance 200,000 data changes per bit**
  - **—Register data retention, 100 years**
- **R_{TOTAL} value = 12.5kΩ, 50kΩ**
- **Packages**
 - **—8-lead MSOP, FCP, TDFN**

DESCRIPTION

The Xicor X93156 is a three-terminal digitally controlled potentiometer (XDCP). The device consists of a resistor array, wiper switches, a control section, and nonvolatile memory. The wiper position is controlled by an Up/Down interface.

The potentiometer is implemented by a resistor array composed of 31 resistive elements and a wiper switching network. The position of the wiper element is controlled by the $\overline{CS}$, U/$\overline{D}$, and $\overline{INC}$ inputs. The position of the wiper can be stored in nonvolatile memory and then be recalled upon a subsequent power-up operation.

The device can be used as a three-terminal potentiometer or as a two terminal variable resistor in a wide variety of applications including the programming of bias voltages, LCD brightness and contrast control as well as the implemetnation of ladder networks.

X93156 ORDERING CODES

Ordering Number	RTOTAL	Package	Temperature Range
X93156WM8I-2.7	12.5kΩ	8-lead MSOP package	-40°C to +85°C
X93156UM8I-2.7	50kΩ	8-lead MSOP package	-40°C to +85°C

PIN DESCRIPTIONS

MSOP TDFN	Symbol	Brief Description
1	$\overline{INC}$	**Increment ($\overline{INC}$).** The $\overline{INC}$ input is negative-edge triggered. Toggling $\overline{INC}$ will move the wiper and either increment or decrement the counter in the direction indicated by the logic level on the U/$\overline{D}$ input.
2	U/$\overline{D}$	**Up/Down (U/$\overline{D}$).** The U/$\overline{D}$ input controls the direction of the wiper movement and whether the counter is incremented or decremented.
3	R_H	**R_H.** The R_H and R_L pins of the X93156 are equivalent to the fixed terminals of a mechanical potentiometer. The minimum voltage is V_{SS} and the maximum is V_{CC}. The terminology of R_H and R_L references the relative position of the terminal in relation to wiper movement direction selected by the U/$\overline{D}$ input.
4	V_{SS}	**Ground.**
5	Rw	**R_W.** The Rw pin of the X93156 is the wiper terminal of the potentiometer which is equivalent to the movable terminal of a mechanical potentiometer.
6	R_L	**R_L.** The R_H and R_L pins of the X93156 are equivalent to the fixed terminals of a mechanical potentiometer. The minimum voltage is V_{SS} and the maximum is V_{CC}. The terminology of R_H and R_L references the relative position of the terminal in relation to wiper movement direction selected by the U/$\overline{D}$ input.
7	$\overline{CS}$	**Chip Select ($\overline{CS}$).** The device is selected when the $\overline{CS}$ input is LOW. The current counter value is stored in nonvolatile memory when $\overline{CS}$ is returned HIGH while the $\overline{INC}$ input is also HIGH. After the store operation is complete, the X93156 will be placed in the low power standby mode until the device is selected once again.
8	V_{CC}	**Supply Voltage.**

ABSOLUTE MAXIMUM RATINGS

Temperature under bias .... –65°C to +135°C
Storage temperature .... –65°C to +150°C
Voltage on $\overline{CS}$, $\overline{INC}$, U/$\overline{D}$, R_H, R_L and V_{CC}
   with respect to V_{SS} .... –1V to +6.5V
Lead temperature (soldering 10 seconds)........ 300°C
Maximum reflow temperature (40 seconds) ...... 240°C
Maximum resistor current..................................... 2mA

COMMENT

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only; the functional operation of the device (at these or any other conditions above those listed in the operational sections of this specification) is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

Temperature	Min.	Max.
Industrial	–40°C	+85°C

Supply Voltage (V_{CC})	Limits
X93156	2.7 V to 5.5 V [7]

POTENTIOMETER CHARACTERISTICS (Over recommended operating conditions unless otherwise stated.)

Symbol	Parameter	Limits				Test Conditions/Notes
		Min.	Typ.	Max.	Unit	
R_{TOT}	End to end resistance	9.375	12.5	15.625	kΩ	
		37.5	50	62.5	kΩ	
V_R	R_H, R_L terminal voltages	0		V_{CC}	V	
	Power rating			1	mW[6]	
	Noise		-120		dBV[6]	Ref: 1kHz
R_W	Wiper Resistance			1100	Ω	[4]
I_W	Wiper Current			0.6	mA	[4] [5]
	Resolution		3		%	
	Absolute linearity[1]			±1	MI[3]	$V_{H(n)}(\text{actual}) - V_{H(n)}(\text{expected})$
	Relative linearity[2]			±0.5	MI[3]	$V_{H(n+1)} - [V_{H(n)} + MI]$
	R_{TOTAL} temperature coefficient		±35		ppm/°C	[6]
$C_H/C_L/C_W$	Potentiometer capacitances		10/10/25		pF[6]	See circuit #2

Notes: (1) Absolute linearity is utilized to determine actual wiper voltage versus expected voltage = ($V_{H(n)}(\text{actual}) - V_{H(n)}(\text{expected})$) = ±1 MI Maximum. n = 1 .. 29 only.

(2) Relative linearity is a measure of the error in step size between taps = $V_{H(n+1)} - [V_{H(n)} + MI]$ = ±0.5 MI, n = 1 .. 29 only.

(3) 1 MI = Minimum Increment = $R_{TOT}/31$.

(4) Typical values are for T_A = 25°C and nominal supply voltage.

(5) This parameter is periodically sampled and not 100% tested

(6) This parameter is not 100% tested.

(7) When performing multiple write operations, V_{CC} must not decrease by more than 150mV from it's initial value.

POWER UP AND DOWN REQUIREMENTS

There are no restrictions on the power-up or power-down conditions of V_{CC} and the voltages applied to the potentiometer pins provided that V_{CC} is always more positive than or equal to V_H and V_L, i.e., $V_{CC} \geq V_H, V_L$. The V_{CC} ramp rate spec is always in effect.

A.C. Timing
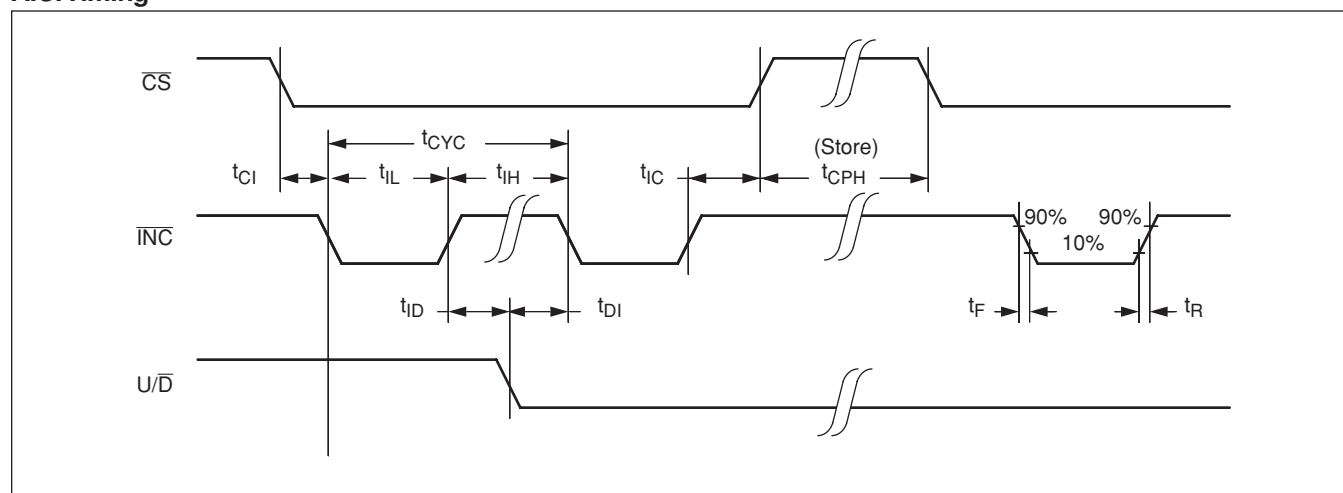

PIN DESCRIPTIONS

R_H and R_L

The R_H and R_L pins of the X93156 are equivalent to the fixed terminals of a mechanical potentiometer. The minimum voltage is V_{SS} and the maximum is V_{CC}. The terminology of R_H and R_L references the relative position of the terminal in relation to wiper movement direction selected by the $U/\overline{D}$ input.

R_W

The Rw pin of the X93156 is the wiper terminal of the potentiometer which is equivalent to the movable terminal of a mechanical potentiometer

Up/Down ($U/\overline{D}$)

The $U/\overline{D}$ input controls the direction of the wiper movement and whether the counter is incremented or decremented.

Increment ($\overline{INC}$)

The $\overline{INC}$ input is negative-edge triggered. Toggling $\overline{INC}$ will move the wiper and either increment or decrement the counter in the direction indicated by the logic level on the $U/\overline{D}$ input.

Chip Select ($\overline{CS}$)

The device is selected when the $\overline{CS}$ input is LOW. The current counter value is stored in nonvolatile memory when $\overline{CS}$ is returned HIGH while the $\overline{INC}$ input is also HIGH. After the store operation is complete the X93156 will be placed in the low power standby mode until the device is selected once again.

PRINCIPLES OF OPERATION

There are three sections of the X93156: the input control, counter and decode section; the nonvolatile memory; and the resistor array. The input control section operates just like an up/down counter. The output of this counter is decoded to turn on a single electronic switch connecting a point on the resistor array to the wiper output. Under the proper conditions the contents of the counter can be stored in nonvolatile memory and retained for future use. The resistor array is comprised of 31 individual resistors connected in series. At either end of the array and between each resistor is an electronic switch that transfers the connection at that point to the wiper.

The wiper, when at either fixed terminal, acts like its mechanical equivalent and does not move beyond the last position. That is, the counter does not wrap around when clocked to either extreme.

If the wiper is moved several positions, multiple taps are connected to the wiper for t_{IW} ($\overline{INC}$ to V_W change). The 2-terminal resistance value for the device can temporarily change by a significant amount if the wiper is moved several positions.

When the device is powered-down, the last wiper position stored will be maintained in the nonvolatile memory. When power is restored, the contents of the memory are recalled and the wiper is set to the value last stored.

INSTRUCTIONS AND PROGRAMMING

The $\overline{INC}$, U/$\overline{D}$ and $\overline{CS}$ inputs control the movement of the wiper along the resistor array. With $\overline{CS}$ set LOW the device is selected and enabled to respond to the U/$\overline{D}$ and $\overline{INC}$ inputs. HIGH to LOW transitions on $\overline{INC}$ will increment or decrement (depending on the state of the U/$\overline{D}$ input) a five bit counter. The output of this counter is decoded to select one of thirty two wiper positions along the resistive array.

The value of the counter is stored in nonvolatile memory whenever $\overline{CS}$ transitions HIGH while the $\overline{INC}$ input is also HIGH. In order to avoid an accidental store during power-up, $\overline{CS}$ must go HIGH with V_{CC} during initial power-up. When left open, the $\overline{CS}$ pin is internally pulled up to V_{CC} by an internal 30k resistor.

The system may select the X93156, move the wiper and deselect the device without having to store the latest wiper position in nonvolatile memory. After the wiper movement is performed as described above and once the new position is reached, the system must keep $\overline{INC}$ LOW while taking $\overline{CS}$ HIGH. The new wiper position will be maintained until changed by the system or until a power-up/down cycle recalled the previously stored data. In order to recall the stored position of the wiper on power-up, the $\overline{CS}$ pin must be held HIGH.

This procedure allows the system to always power-up to a preset value stored in nonvolatile memory; then during system operation minor adjustments could be made. The adjustments might be based on user preference, system parameter changes due to temperature drift, or other system trim requirements.

The state of U/$\overline{D}$ may be changed while $\overline{CS}$ remains LOW. This allows the host system to enable the device and then move the wiper up and down until the proper trim is attained.
MODE SELECTION

$\overline{CS}$	$\overline{INC}$	U/$\overline{D}$	Mode
L	⌐_	H	Wiper Up
L	⌐_	L	Wiper Down
_⌐	H	X	Store Wiper Position
H	X	X	Standby Current
_⌐	L	X	No Store, Return to Standby
⌐_	L	H	Wiper Up (not recommended)
⌐_	L	L	Wiper Down (not recommended)

LIMITED WARRANTY

Devices sold by Xicor, Inc. are covered by the warranty and patent indemnification provisions appearing in its Terms of Sale only. Xicor, Inc. makes no warranty, express, statutory, implied, or by description regarding the information set forth herein or regarding the freedom of the described devices from patent infringement. Xicor, Inc. makes no warranty of merchantability or fitness for any purpose. Xicor, Inc. reserves the right to discontinue production and change specifications and prices at any time and without notice.

Xicor, Inc. assumes no responsibility for the use of any circuitry other than circuitry embodied in a Xicor, Inc. product. No other circuits, patents, or licenses are implied.

TRADEMARK DISCLAIMER:

Xicor and the Xicor logo are registered trademarks of Xicor, Inc. AutoStore, Direct Write, Block Lock, SerialFlash, MPS, BiasLock and XDCP are also trademarks of Xicor, Inc. All others belong to their respective owners.

U.S. PATENTS

Xicor products are covered by one or more of the following U.S. Patents: 4,326,134; 4,393,481; 4,404,475; 4,450,402; 4,486,769; 4,488,060; 4,520,461; 4,533,846; 4,599,706; 4,617,652; 4,668,932; 4,752,912; 4,829,482; 4,874,967; 4,883,976; 4,980,859; 5,012,132; 5,003,197; 5,023,694; 5,084,667; 5,153,880; 5,153,691; 5,161,137; 5,219,774; 5,270,927; 5,324,676; 5,434,396; 5,544,103; 5,587,573; 5,835,409; 5,977,585. Foreign patents and additional patents pending.

LIFE RELATED POLICY

In situations where semiconductor component failure may endanger life, system designers using this product should design the system with appropriate error detection and correction, redundancy and back-up features to prevent such an occurrence.

Xicor's products are not authorized for use in critical components in life support devices or systems.

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.

2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
